having a nucleotide sequence which is at least partly complementary to VGAM3577 RNA, herein designated VGAM RNA, and which when bound by VGAM3577 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3577 host target proteins.

[50045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3577 gene, herein designated VGAM GENE, on one or more VGAM3577 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50046] It is yet further appreciated that a function of VGAM3577

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3577 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3577 correlate with, and may be deduced from, the identity of the host target genes which VGAM3577 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50047] Nucleotide sequences of the VGAM3577 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3577 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3577 are further described hereinbelow with reference to Table 1.

[50048] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3577 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50049] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3578 (VGAM3578) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50050] VGAM3578 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3578 was detected is described hereinabove with reference to Figs. 2–8.

[50051] VGAM3578 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cherry necrotic rusty mottle virus. VGAM3578 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50052] VGAM3578 gene, herein designated VGAM GENE, encodes a VGAM3578 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3578 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3578 precursor RNA is designated SEQ ID:81058, and is provided

hereinbelow with reference to the sequence listing part.

[50053] VGAM3578 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50054] An enzyme complex designated DICER COMPLEX, dices the VGAM3578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3578 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3578 RNA is designated SEQ ID:81059, and is provided hereinbelow with reference to the sequence listing part.

[50055] VGAM3578 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3578 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3578 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50056] VGAM3578 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3578 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3578 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3578 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3578 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50057] The complementary binding of VGAM3578 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3578 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3578 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3578 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50058] It is appreciated that VGAM3578 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3578 host target genes. The mRNA of each one of this plurality of VGAM3578 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3578 RNA, herein designated VGAM RNA, and which when bound by VGAM3578 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3578 host target proteins.

[50059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3578 gene, herein designated VGAM GENE, on one or more VGAM3578 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50060] It is yet further appreciated that a function of VGAM3578 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3578 include diagnosis, prevention and treatment of viral infection by Cherry necrotic rusty mottle virus. Specific functions, and accordingly utilities, of VGAM3578 correlate with, and may be deduced from, the identity of the host target genes which VGAM3578 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50061] Nucleotide sequences of the VGAM3578 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3578 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3578 are further described hereinbelow with reference to Table 1.

[50062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3578 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50063] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3579 (VGAM3579) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50064] VGAM3579 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3579 was detected is described hereinabove with reference to Figs. 2–8.

[50065] VGAM3579 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM3579 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50066] VGAM3579 gene, herein designated VGAM GENE, encodes a VGAM3579 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3579 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3579 precursor RNA is designated SEQ ID:81069, and is provided hereinbelow with reference to the sequence listing part.

[50067] VGAM3579 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50068] An enzyme complex designated DICER COMPLEX, dices the VGAM3579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3579 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3579 RNA is designated SEQ ID:81070, and is provided hereinbelow with reference to the sequence listing part.

[50069] VGAM3579 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3579 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3579 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50070] VGAM3579 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3579 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3579 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3579 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3579 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50071] The complementary binding of VGAM3579 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3579 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3579 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3579 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50072] It is appreciated that VGAM3579 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3579 host target genes. The mRNA of each one of this plurality of VGAM3579 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3579 RNA, herein designated VGAM RNA, and which when bound by VGAM3579 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3579 host target proteins.

[50073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3579 gene, herein designated VGAM GENE, on one or more VGAM3579 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50074] It is yet further appreciated that a function of VGAM3579 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3579 include diagnosis, prevention and

treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM3579 correlate with, and may be deduced from, the identity of the host target genes which VGAM3579 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50075] Nucleotide sequences of the VGAM3579 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3579 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3579 are further described hereinbelow with reference to Table 1.

[50076] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3579 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50077] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3580 (VGAM3580) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50078] VGAM3580 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3580 was detected is described hereinabove with reference to Figs. 2–8.

[50079] VGAM3580 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 15. VGAM3580 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50080] VGAM3580 gene, herein designated VGAM GENE, encodes a VGAM3580 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3580 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3580 precursor RNA is designated SEQ ID:81076, and is provided hereinbelow with reference to the sequence listing part.

[50081] VGAM3580 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3580 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50082] An enzyme complex designated DICER COMPLEX, dices the VGAM3580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3580 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3580 RNA is designated SEQ ID:81077, and is provided hereinbelow with reference to the sequence listing part.

[50083] VGAM3580 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3580 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3580 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50084] VGAM3580 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3580 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3580 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3580 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3580 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50085] The complementary binding of VGAM3580 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3580 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3580 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3580 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50086] It is appreciated that VGAM3580 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3580 host target genes. The mRNA of each one of this plurality of VGAM3580 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3580 RNA, herein designated VGAM RNA, and which when bound by VGAM3580 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3580 host target proteins.

[50087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3580 gene, herein designated VGAM GENE, on one or more VGAM3580 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50088] It is yet further appreciated that a function of VGAM3580 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3580 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type

15. Specific functions, and accordingly utilities, of VGAM3580 correlate with, and may be deduced from, the identity of the host target genes which VGAM3580 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50089] Nucleotide sequences of the VGAM3580 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3580 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3580 are further described hereinbelow with reference to Table 1.

[50090] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3580 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50091] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3581 (VGAM3581) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[50092] VGAM3581 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3581 was detected is described hereinabove with reference to Figs. 2–8.

[50093] VGAM3581 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3581 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50094] VGAM3581 gene, herein designated VGAM GENE, encodes a VGAM3581 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3581 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3581 precursor RNA is designated SEQ ID:81131, and is provided hereinbelow with reference to the sequence listing part.

[50095] VGAM3581 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3581 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50096] An enzyme complex designated DICER COMPLEX, dices the VGAM3581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3581 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3581 RNA is designated SEQ ID:81132, and is provided hereinbelow with reference to the sequence listing part.

[50097] VGAM3581 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3581 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3581 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50098] VGAM3581 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3581 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3581 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3581 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3581 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50099] The complementary binding of VGAM3581 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3581 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3581 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3581 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50100] It is appreciated that VGAM3581 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3581 host target genes. The mRNA of each one of this plurality of VGAM3581 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3581 RNA, herein designated VGAM RNA, and which when bound by VGAM3581 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3581 host target proteins.

[50101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3581 gene, herein designated VGAM GENE, on one or more VGAM3581 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50102] It is yet further appreciated that a function of VGAM3581 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3581 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3581

correlate with, and may be deduced from, the identity of the host target genes which VGAM3581 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50103] Nucleotide sequences of the VGAM3581 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3581 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3581 are further described hereinbelow with reference to Table 1.

[50104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3581 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50105] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3582 (VGAM3582) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[50106] VGAM3582 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3582 was detected is described hereinabove with reference to Figs. 2–8.

[50107] VGAM3582 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM3582 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50108] VGAM3582 gene, herein designated VGAM GENE, encodes a VGAM3582 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3582 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3582 precursor RNA is designated SEQ ID:81141, and is provided hereinbelow with reference to the sequence listing part.

[50109] VGAM3582 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50110] An enzyme complex designated DICER COMPLEX, dices the VGAM3582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3582 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3582 RNA is designated SEQ ID:81142, and is provided hereinbelow with reference to the sequence listing part.

[50111] VGAM3582 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3582 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3582 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50112] VGAM3582 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3582 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3582 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3582 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3582 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50113] The complementary binding of VGAM3582 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3582 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3582 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3582 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50114] It is appreciated that VGAM3582 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3582 host target genes. The mRNA of each one of this plurality of VGAM3582 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3582 RNA, herein designated VGAM RNA, and which when bound by VGAM3582 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3582 host target proteins.

[50115] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3582 gene, herein designated VGAM GENE, on one or more VGAM3582 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50116] It is yet further appreciated that a function of VGAM3582 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3582 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3582 correlate with, and may be deduced from, the identity of the

host target genes which VGAM3582 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50117] Nucleotide sequences of the VGAM3582 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3582 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3582 are further described hereinbelow with reference to Table 1.

[50118] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3582 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50119] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3583 (VGAM3583) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50120] VGAM3583 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3583 was detected is described hereinabove with reference to Figs. 2–8.

[50121] VGAM3583 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco etch virus. VGAM3583 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50122] VGAM3583 gene, herein designated VGAM GENE, encodes a VGAM3583 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3583 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3583 precursor RNA is designated SEQ ID:81150, and is provided hereinbelow with reference to the sequence listing part.

[50123] VGAM3583 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50124] An enzyme complex designated DICER COMPLEX, dices the VGAM3583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3583 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3583 RNA is designated SEQ ID:81151, and is provided hereinbelow with reference to the sequence listing part.

[50125] VGAM3583 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3583 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3583 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50126] VGAM3583 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3583 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3583 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3583 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3583 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50127] The complementary binding of VGAM3583 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3583 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3583 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3583 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50128] It is appreciated that VGAM3583 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3583 host target genes. The mRNA of each one of this plurality of VGAM3583 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3583 RNA, herein designated VGAM RNA, and which when bound by VGAM3583 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3583 host target proteins.

[50129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3583 gene, herein designated VGAM GENE, on one or more VGAM3583 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50130] It is yet further appreciated that a function of VGAM3583 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3583 include diagnosis, prevention and treatment of viral infection by Tobacco etch virus. Specific functions, and accordingly utilities, of VGAM3583 correlate with, and may be deduced from, the identity of the host target genes which VGAM3583 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[50131] Nucleotide sequences of the VGAM3583 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3583 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3583 are further described hereinbelow with reference to Table 1.

[50132] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3583 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50133] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3584 (VGAM3584) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50134] VGAM3584 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3584 was detected is described hereinabove with reference to Figs. 2–8.

[50135] VGAM3584 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3584 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50136] VGAM3584 gene, herein designated VGAM GENE, encodes a VGAM3584 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3584 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3584 precursor RNA is designated SEQ ID:81158, and is provided hereinbelow with reference to the sequence listing part.

[50137] VGAM3584 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50138] An enzyme complex designated DICER COMPLEX, dices the VGAM3584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3584 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3584 RNA is designated SEQ ID:81159, and is provided hereinbelow with reference to the sequence listing part.

[50139] VGAM3584 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3584 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3584 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50140] VGAM3584 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3584 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3584 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3584 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3584 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[50141] The complementary binding of VGAM3584 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3584 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3584 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3584 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50142] It is appreciated that VGAM3584 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3584 host target genes. The mRNA of each one of this plurality of VGAM3584 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3584 RNA, herein designated VGAM RNA, and which when bound by VGAM3584 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3584 host target proteins.

[50143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3584 gene, herein designated VGAM GENE, on one or more VGAM3584 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50144] It is yet further appreciated that a function of VGAM3584 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3584 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3584 correlate with, and may be deduced from, the identity of the host target genes which VGAM3584 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[50145] Nucleotide sequences of the VGAM3584 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3584 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3584 are further described hereinbelow with reference to Table 1.

[50146] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3584 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50147] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3585 (VGAM3585) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50148] VGAM3585 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3585 was detected is described hereinabove with reference to Figs. 2–8.

[50149] VGAM3585 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3585 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50150] VGAM3585 gene, herein designated VGAM GENE, encodes a VGAM3585 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3585 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3585 precursor RNA is designated SEQ ID:81163, and is provided hereinbelow with reference to the sequence listing part.

[50151] VGAM3585 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50152] An enzyme complex designated DICER COMPLEX, dices the VGAM3585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3585 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3585 RNA is designated SEQ ID:81164, and is provided hereinbelow with reference to the sequence listing part.

[50153] VGAM3585 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3585 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3585 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[50154] VGAM3585 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3585 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3585 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3585 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3585 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50155] The complementary binding of VGAM3585 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3585 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3585 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3585 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50156] It is appreciated that VGAM3585 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3585 host target genes. The mRNA of each one of this plurality of VGAM3585 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3585 RNA, herein designated VGAM RNA, and which when bound by VGAM3585 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3585 host target proteins.

[50157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3585 gene, herein designated VGAM GENE, on one

or more VGAM3585 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50158] It is yet further appreciated that a function of VGAM3585 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3585 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3585 correlate with, and may be deduced from, the identity of the host target genes which VGAM3585 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50159] Nucleotide sequences of the VGAM3585 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3585 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3585 are further described hereinbelow with reference to Table 1.

[50160] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3585 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50161] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3586 (VGAM3586) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50162] VGAM3586 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3586 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[50163] VGAM3586 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Common chimpanzee papillomavirus 1. VGAM3586 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50164] VGAM3586 gene, herein designated VGAM GENE, encodes a VGAM3586 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3586 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3586 precursor RNA is designated SEQ ID:81167, and is provided hereinbelow with reference to the sequence listing part.

[50165] VGAM3586 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50166] An enzyme complex designated DICER COMPLEX, dices the VGAM3586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3586 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3586 RNA is designated SEQ ID:81168, and is provided hereinbelow with reference to the sequence listing part.

[50167] VGAM3586 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3586 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3586 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50168] VGAM3586 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3586 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3586 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3586 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3586 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50169] The complementary binding of VGAM3586 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3586 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3586 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3586 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50170] It is appreciated that VGAM3586 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3586 host target genes. The mRNA of each one of this plurality of VGAM3586 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3586 RNA, herein designated VGAM RNA, and which when bound by VGAM3586 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3586 host target proteins.

[50171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3586 gene, herein designated VGAM GENE, on one or more VGAM3586 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50172] It is yet further appreciated that a function of VGAM3586 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3586 include diagnosis, prevention and treatment of viral infection by Common chimpanzee papillomavirus 1. Specific functions, and accordingly utilities, of VGAM3586 correlate with, and may be deduced from, the identity of the host target genes which VGAM3586 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50173] Nucleotide sequences of the VGAM3586 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3586 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3586 are further described hereinbelow with reference to Table 1.

[50174] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3586 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50175] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3587 (VGAM3587) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50176] VGAM3587 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3587 was detected is described hereinabove with reference to Figs. 2-8.

[50177] VGAM3587 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3587 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50178] VGAM3587 gene, herein designated VGAM GENE, encodes a VGAM3587 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3587 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3587 precursor RNA is designated SEQ ID:81184, and is provided hereinbelow with reference to the sequence listing part.

[50179] VGAM3587 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[50180] An enzyme complex designated DICER COMPLEX, dices the VGAM3587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3587 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3587 RNA is designated SEQ ID:81185, and is provided hereinbelow with reference to the sequence listing part.

[50181] VGAM3587 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3587 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3587 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50182] VGAM3587 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3587 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3587 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3587 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3587 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50183] The complementary binding of VGAM3587 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3587 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3587 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3587 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50184] It is appreciated that VGAM3587 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3587 host target genes. The mRNA of each one of this plurality of VGAM3587 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3587 RNA, herein designated VGAM RNA, and which when bound by VGAM3587 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3587 host target proteins.

[50185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3587 gene, herein designated VGAM GENE, on one or more VGAM3587 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50186] It is yet further appreciated that a function of VGAM3587 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3587 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3587 correlate with, and may be deduced from, the identity of the host target genes which VGAM3587 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50187] Nucleotide sequences of the VGAM3587 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3587 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3587 are further described hereinbelow with reference to Table 1.

[50188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3587 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50189] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3588 (VGAM3588) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50190] VGAM3588 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3588 was detected is described hereinabove with reference to Figs. 2-8.

[50191] VGAM3588 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus.

VGAM3588 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50192] VGAM3588 gene, herein designated VGAM GENE, encodes a VGAM3588 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3588 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3588 precursor RNA is designated SEQ ID:81191, and is provided hereinbelow with reference to the sequence listing part.

[50193] VGAM3588 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50194] An enzyme complex designated DICER COMPLEX, dices the VGAM3588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3588 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3588 RNA is designated SEQ ID:81192, and is provided hereinbelow with reference to the sequence listing part.

[50195] VGAM3588 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3588 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3588 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50196] VGAM3588 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3588 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3588 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3588 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3588 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50197] The complementary binding of VGAM3588 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3588 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3588 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3588 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50198] It is appreciated that VGAM3588 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3588 host target genes. The mRNA of each one of this plurality of VGAM3588 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3588 RNA, herein designated VGAM RNA, and which when bound by VGAM3588 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3588 host target proteins.

[50199] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3588 gene, herein designated VGAM GENE, on one or more VGAM3588 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50200] It is yet further appreciated that a function of VGAM3588 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3588 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3588 correlate with, and may be deduced from, the identity of the host target genes which VGAM3588 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50201] Nucleotide sequences of the VGAM3588 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3588 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3588 are further described hereinbelow with reference to Table 1.

[50202] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3588 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50203] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3589 (VGAM3589) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50204] VGAM3589 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3589 was detected is described hereinabove with reference to Figs. 2-8.

[50205] VGAM3589 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3.

VGAM3589 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50206] VGAM3589 gene, herein designated VGAM GENE, encodes a VGAM3589 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3589 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3589 precursor RNA is designated SEQ ID:81222, and is provided hereinbelow with reference to the sequence listing part.

[50207] VGAM3589 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50208] An enzyme complex designated DICER COMPLEX, dices

the VGAM3589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3589 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3589 RNA is designated SEQ ID:81223, and is provided hereinbelow with reference to the sequence listing part.

[50209] VGAM3589 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3589 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3589 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50210] VGAM3589 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3589 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3589 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3589 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3589 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50211] The complementary binding of VGAM3589 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3589 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3589 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3589 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50212] It is appreciated that VGAM3589 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3589 host target genes. The mRNA of each one of this plurality of VGAM3589 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3589 RNA, herein designated VGAM RNA, and which when bound by VGAM3589 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3589 host target proteins.

[50213] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3589 gene, herein designated VGAM GENE, on one or more VGAM3589 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50214] It is yet further appreciated that a function of VGAM3589 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3589 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3589 correlate with, and may be deduced from, the identity of the host target genes which VGAM3589 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50215] Nucleotide sequences of the VGAM3589 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3589 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3589 are further described hereinbelow with reference to Table 1.

[50216] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3589 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50217] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3590 (VGAM3590) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50218] VGAM3590 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3590 was detected is described hereinabove with reference to Figs. 2-8.

[50219] VGAM3590 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus Y. VGAM3590 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[50220] VGAM3590 gene, herein designated VGAM GENE, encodes a VGAM3590 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3590 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3590 precursor RNA is designated SEQ ID:81233, and is provided hereinbelow with reference to the sequence listing part.

[50221] VGAM3590 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50222] An enzyme complex designated DICER COMPLEX, dices the VGAM3590 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3590 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3590 RNA is designated SEQ ID:81234, and is provided hereinbelow with reference to the sequence listing part.

[50223] VGAM3590 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3590 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3590 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50224] VGAM3590 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3590 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3590 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3590 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3590 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50225] The complementary binding of VGAM3590 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3590 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3590

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3590 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50226] It is appreciated that VGAM3590 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3590 host target genes. The mRNA of each one of this plurality of VGAM3590 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3590 RNA, herein designated VGAM RNA, and which when bound by VGAM3590 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3590 host target proteins.

[50227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3590 gene, herein designated VGAM GENE, on one or more VGAM3590 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50228] It is yet further appreciated that a function of VGAM3590 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3590 include diagnosis, prevention and treatment of viral infection by Potato virus Y. Specific functions, and accordingly utilities, of VGAM3590 correlate with, and may be deduced from, the identity of the host target genes which VGAM3590 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50229] Nucleotide sequences of the VGAM3590 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3590 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3590 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3590 are further described hereinbelow with reference to Table 1.

[50230] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3590 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50231] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3591 (VGAM3591) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50232] VGAM3591 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3591 was detected is described hereinabove with reference to Figs. 2-8.

[50233] VGAM3591 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3591 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[50234] VGAM3591 gene, herein designated VGAM GENE, encodes a VGAM3591 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3591 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3591 precursor RNA is designated SEQ ID:81252, and is provided hereinbelow with reference to the sequence listing part.

[50235] VGAM3591 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50236] An enzyme complex designated DICER COMPLEX, dices the VGAM3591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3591 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3591 RNA is designated SEQ ID:81253, and is provided hereinbelow with reference to the sequence listing part.

[50237] VGAM3591 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3591 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3591 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50238] VGAM3591 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3591 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3591 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3591 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3591 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50239] The complementary binding of VGAM3591 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3591 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3591 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3591 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50240] It is appreciated that VGAM3591 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3591 host target genes. The mRNA of each one of this plurality of VGAM3591 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3591 RNA, herein designated VGAM RNA, and which when bound by VGAM3591 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3591 host target proteins.

[50241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3591 gene, herein designated VGAM GENE, on one or more VGAM3591 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50242] It is yet further appreciated that a function of VGAM3591 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3591 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3591 correlate with, and may be deduced from, the identity of the host target genes which VGAM3591 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50243] Nucleotide sequences of the VGAM3591 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3591 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3591 are further

described hereinbelow with reference to Table 1.

[50244] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3591 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50245] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3592 (VGAM3592) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50246] VGAM3592 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3592 was detected is described hereinabove with reference to Figs. 2-8.

[50247] VGAM3592 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute bee paralysis virus. VGAM3592 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50248] VGAM3592 gene, herein designated VGAM GENE, encodes a VGAM3592 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3592 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3592 precursor RNA is designated SEQ ID:81255, and is provided hereinbelow with reference to the sequence listing part.

[50249] VGAM3592 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50250] An enzyme complex designated DICER COMPLEX, dices the VGAM3592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3592 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3592 RNA is designated SEQ ID:81256, and is provided hereinbelow with reference to the sequence listing part.

[50251] VGAM3592 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3592 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3592 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50252] VGAM3592 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3592 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3592 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3592 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3592 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50253] The complementary binding of VGAM3592 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3592 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3592 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3592 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50254] It is appreciated that VGAM3592 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3592 host target genes. The mRNA of each one of this plurality of VGAM3592 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3592 RNA, herein designated VGAM RNA, and which when bound by VGAM3592 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3592 host target proteins.

[50255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3592 gene, herein designated VGAM GENE, on one or more VGAM3592 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50256] It is yet further appreciated that a function of VGAM3592 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3592 include diagnosis, prevention and treatment of viral infection by Acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM3592 correlate with, and may be deduced from, the identity of the host target genes which VGAM3592 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50257] Nucleotide sequences of the VGAM3592 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3592 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3592 are further described hereinbelow with reference to Table 1.

[50258] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3592 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50259] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3593 (VGAM3593) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50260] VGAM3593 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3593 was detected is described hereinabove with reference to Figs. 2-8.

[50261] VGAM3593 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM3593 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50262] VGAM3593 gene, herein designated VGAM GENE, encodes

a VGAM3593 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3593 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3593 precursor RNA is designated SEQ ID:81293, and is provided hereinbelow with reference to the sequence listing part.

[50263] VGAM3593 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50264] An enzyme complex designated DICER COMPLEX, dices the VGAM3593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3593 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3593 RNA is designated SEQ ID:81294, and is provided hereinbelow with reference to the sequence listing part.

[50265] VGAM3593 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3593 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3593 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50266] VGAM3593 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3593 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3593 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3593 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3593 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50267] The complementary binding of VGAM3593 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3593 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3593 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3593 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[50268] It is appreciated that VGAM3593 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3593 host target genes. The mRNA of each one of this plurality of VGAM3593 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3593 RNA, herein designated VGAM RNA, and which when bound by VGAM3593 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3593 host target proteins.

[50269] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3593 gene, herein designated VGAM GENE, on one or more VGAM3593 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50270] It is yet further appreciated that a function of VGAM3593 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3593 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3593 correlate with, and may be deduced from, the identity of the host target genes which VGAM3593 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50271] Nucleotide sequences of the VGAM3593 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3593 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3593 are further described hereinbelow with reference to Table 1.

[50272] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3593 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50273] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3594 (VGAM3594) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50274] VGAM3594 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3594 was detected is described hereinabove with reference to Figs. 2-8.

[50275] VGAM3594 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM3594 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50276] VGAM3594 gene, herein designated VGAM GENE, encodes a VGAM3594 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3594 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3594 precursor RNA is designated SEQ ID:81305, and is provided hereinbelow with reference to the sequence listing part.

[50277] VGAM3594 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50278] An enzyme complex designated DICER COMPLEX, dices the VGAM3594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3594 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3594 RNA is designated SEQ ID:81306, and is provided hereinbelow with reference to the sequence listing part.

[50279] VGAM3594 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3594 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3594 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50280] VGAM3594 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3594 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3594 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3594 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3594 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50281] The complementary binding of VGAM3594 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3594 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3594 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3594 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50282] It is appreciated that VGAM3594 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3594 host target genes. The mRNA of each one of this plurality of VGAM3594 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3594 RNA, herein designated VGAM RNA, and which when bound by VGAM3594 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3594 host target proteins.

[50283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3594 gene, herein designated VGAM GENE, on one or more VGAM3594 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50284] It is yet further appreciated that a function of VGAM3594 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3594 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3594 correlate with, and may be deduced from, the identity of the host target genes which VGAM3594 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50285] Nucleotide sequences of the VGAM3594 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3594 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3594 are further described hereinbelow with reference to Table 1.

[50286] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3594 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50287] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3595 (VGAM3595) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50288] VGAM3595 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3595 was detected is described hereinabove with reference to Figs. 2-8.

[50289] VGAM3595 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3595 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50290] VGAM3595 gene, herein designated VGAM GENE, encodes a VGAM3595 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3595 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3595 precursor RNA is designated SEQ ID:81354, and is provided hereinbelow with reference to the sequence listing part.

[50291] VGAM3595 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50292] An enzyme complex designated DICER COMPLEX, dices the VGAM3595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3595 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3595 RNA is designated SEQ ID:81355, and is provided hereinbelow with reference to the sequence listing part.

[50293] VGAM3595 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3595 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3595 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50294] VGAM3595 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3595 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3595 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3595 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3595 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50295] The complementary binding of VGAM3595 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3595 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3595 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3595 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50296] It is appreciated that VGAM3595 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3595 host target genes. The mRNA of each one of this plurality of VGAM3595 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3595 RNA, herein designated VGAM RNA, and which when bound by VGAM3595 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3595 host target proteins.

[50297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3595 gene, herein designated VGAM GENE, on one or more VGAM3595 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50298] It is yet further appreciated that a function of VGAM3595 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3595 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3595 correlate with, and may be deduced from, the identity of the host target genes which VGAM3595 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50299] Nucleotide sequences of the VGAM3595 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3595 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3595 are further described hereinbelow with reference to Table 1.

[50300] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3595 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50301] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3596 (VGAM3596) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50302] VGAM3596 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3596 was detected is described hereinabove with reference to Figs. 2–8.

[50303] VGAM3596 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3596 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50304] VGAM3596 gene, herein designated VGAM GENE, encodes a VGAM3596 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3596 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3596 precursor RNA is designated SEQ ID:81361, and is provided hereinbelow with reference to the sequence listing part.

[50305] VGAM3596 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50306] An enzyme complex designated DICER COMPLEX, dices the VGAM3596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3596 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3596 RNA is designated SEQ ID:81362, and is provided hereinbelow with reference to the sequence listing part.

[50307] VGAM3596 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3596 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3596 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50308] VGAM3596 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3596 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3596 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3596 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3596 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50309] The complementary binding of VGAM3596 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3596 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3596 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3596 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50310] It is appreciated that VGAM3596 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3596 host target genes. The mRNA of each one of this plurality of VGAM3596 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3596 RNA, herein designated VGAM RNA, and which when bound by VGAM3596 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3596 host target proteins.

[50311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3596 gene, herein designated VGAM GENE, on one or more VGAM3596 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[50312] It is yet further appreciated that a function of VGAM3596 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3596 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3596 correlate with, and may be deduced from, the identity of the host target genes which VGAM3596 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50313] Nucleotide sequences of the VGAM3596 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3596 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3596 are further described hereinbelow with reference to Table 1.

[50314] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3596 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50315] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3597 (VGAM3597) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50316] VGAM3597 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3597 was detected is described hereinabove with reference to Figs. 2-8.

[50317] VGAM3597 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM3597 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50318] VGAM3597 gene, herein designated VGAM GENE, encodes a VGAM3597 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3597 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3597 precursor RNA is designated SEQ ID:81365, and is provided hereinbelow with reference to the sequence listing part.

[50319] VGAM3597 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50320] An enzyme complex designated DICER COMPLEX, dices the VGAM3597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3597 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3597 RNA is designated SEQ ID:81366, and is provided hereinbelow with reference to the sequence listing part.

[50321] VGAM3597 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3597 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3597 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50322] VGAM3597 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3597 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3597 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3597 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3597 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50323] The complementary binding of VGAM3597 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3597 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3597 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3597 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50324] It is appreciated that VGAM3597 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3597 host target genes. The mRNA of

each one of this plurality of VGAM3597 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3597 RNA, herein designated VGAM RNA, and which when bound by VGAM3597 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3597 host target proteins.

[50325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3597 gene, herein designated VGAM GENE, on one or more VGAM3597 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[50326] It is yet further appreciated that a function of VGAM3597 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3597 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3597 correlate with, and may be deduced from, the identity of the host target genes which VGAM3597 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50327] Nucleotide sequences of the VGAM3597 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3597 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3597 are further described hereinbelow with reference to Table 1.

[50328] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3597 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[50329] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3598 (VGAM3598) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50330] VGAM3598 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3598 was detected is described hereinabove with reference to Figs. 2–8.

[50331] VGAM3598 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM3598 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50332] VGAM3598 gene, herein designated VGAM GENE, encodes a VGAM3598 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3598 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3598 precursor RNA is designated SEQ ID:81371, and is provided hereinbelow with reference to the sequence listing part.

[50333] VGAM3598 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50334] An enzyme complex designated DICER COMPLEX, dices the VGAM3598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3598 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3598 RNA is designated SEQ ID:81372,

and is provided hereinbelow with reference to the sequence listing part.

[50335] VGAM3598 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3598 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3598 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50336] VGAM3598 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3598 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3598 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3598 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3598 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50337] The complementary binding of VGAM3598 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3598 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3598 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3598 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50338] It is appreciated that VGAM3598 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3598 host target genes. The mRNA of each one of this plurality of VGAM3598 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3598 RNA, herein designated VGAM RNA, and which when bound by VGAM3598 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3598 host target proteins.

[50339] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3598 gene, herein designated VGAM GENE, on one or more VGAM3598 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50340] It is yet further appreciated that a function of VGAM3598 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3598 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3598 correlate with, and may be deduced from, the identity of the host target genes which VGAM3598 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50341] Nucleotide sequences of the VGAM3598 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3598 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3598 are further described hereinbelow with reference to Table 1.

[50342] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3598 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50343] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3599 (VGAM3599) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50344] VGAM3599 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3599 was detected is described hereinabove with reference to Figs. 2–8.

[50345] VGAM3599 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cymbidium mosaic virus. VGAM3599 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50346] VGAM3599 gene, herein designated VGAM GENE, encodes a VGAM3599 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3599 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3599 precursor

sor RNA is designated SEQ ID:81380, and is provided hereinbelow with reference to the sequence listing part.

[50347] VGAM3599 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50348] An enzyme complex designated DICER COMPLEX, dices the VGAM3599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3599 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3599 RNA is designated SEQ ID:81381, and is provided hereinbelow with reference to the se-

quence listing part.

[50349] VGAM3599 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3599 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3599 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50350] VGAM3599 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3599 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3599 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3599 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3599 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50351] The complementary binding of VGAM3599 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3599 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3599 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3599 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50352] It is appreciated that VGAM3599 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3599 host target genes. The mRNA of each one of this plurality of VGAM3599 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3599 RNA, herein designated VGAM RNA, and which when bound by VGAM3599 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3599 host target proteins.

[50353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3599 gene, herein designated VGAM GENE, on one or more VGAM3599 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50354] It is yet further appreciated that a function of VGAM3599

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3599 include diagnosis, prevention and treatment of viral infection by Cymbidium mosaic virus. Specific functions, and accordingly utilities, of VGAM3599 correlate with, and may be deduced from, the identity of the host target genes which VGAM3599 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50355] Nucleotide sequences of the VGAM3599 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3599 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3599 are further described hereinbelow with reference to Table 1.

[50356] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3599 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50357] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3600 (VGAM3600) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50358] VGAM3600 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3600 was detected is described hereinabove with reference to Figs. 2–8.

[50359] VGAM3600 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3600 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50360] VGAM3600 gene, herein designated VGAM GENE, encodes a VGAM3600 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3600 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3600 precursor RNA is designated SEQ ID:81426, and is provided

hereinbelow with reference to the sequence listing part.

[50361] VGAM3600 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50362] An enzyme complex designated DICER COMPLEX, dices the VGAM3600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3600 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3600 RNA is designated SEQ ID:81427, and is provided hereinbelow with reference to the sequence listing part.

[50363] VGAM3600 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3600 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3600 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50364] VGAM3600 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3600 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3600 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3600 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3600 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50365] The complementary binding of VGAM3600 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3600 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3600 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3600 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50366] It is appreciated that VGAM3600 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3600 host target genes. The mRNA of each one of this plurality of VGAM3600 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3600 RNA, herein designated VGAM RNA, and which when bound by VGAM3600 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3600 host target proteins.

[50367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3600 gene, herein designated VGAM GENE, on one or more VGAM3600 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50368] It is yet further appreciated that a function of VGAM3600 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3600 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3600 correlate with, and may be deduced from, the identity of the host target genes which VGAM3600 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50369] Nucleotide sequences of the VGAM3600 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3600 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3600 are further described hereinbelow with reference to Table 1.

[50370] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3600 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50371] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3601 (VGAM3601) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50372] VGAM3601 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3601 was detected is described hereinabove with reference to Figs. 2–8.

[50373] VGAM3601 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM3601 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50374] VGAM3601 gene, herein designated VGAM GENE, encodes a VGAM3601 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3601 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3601 precursor RNA is designated SEQ ID:81435, and is provided hereinbelow with reference to the sequence listing part.

[50375] VGAM3601 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50376] An enzyme complex designated DICER COMPLEX, dices the VGAM3601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3601 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3601 RNA is designated SEQ ID:81436, and is provided hereinbelow with reference to the sequence listing part.

[50377] VGAM3601 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3601 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3601 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50378] VGAM3601 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3601 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3601 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3601 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3601 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50379] The complementary binding of VGAM3601 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3601 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3601 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3601 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50380] It is appreciated that VGAM3601 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3601 host target genes. The mRNA of each one of this plurality of VGAM3601 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3601 RNA, herein designated VGAM

RNA, and which when bound by VGAM3601 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3601 host target proteins.

[50381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3601 gene, herein designated VGAM GENE, on one or more VGAM3601 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50382] It is yet further appreciated that a function of VGAM3601 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3601 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3601 correlate with, and may be deduced from, the identity of the host target genes which VGAM3601 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50383] Nucleotide sequences of the VGAM3601 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3601 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3601 are further described hereinbelow with reference to Table 1.

[50384] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3601 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50385] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3602 (VGAM3602) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50386] VGAM3602 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3602 was detected is described hereinabove with reference to Figs. 2-8.

[50387] VGAM3602 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3602 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50388] VGAM3602 gene, herein designated VGAM GENE, encodes a VGAM3602 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3602 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3602 precursor RNA is designated SEQ ID:81455, and is provided hereinbelow with reference to the sequence listing part.

[50389] VGAM3602 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50390] An enzyme complex designated DICER COMPLEX, dices the VGAM3602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3602 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3602 RNA is designated SEQ ID:81456, and is provided hereinbelow with reference to the sequence listing part.

[50391] VGAM3602 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3602 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3602 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50392] VGAM3602 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3602 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3602 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3602 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3602 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50393] The complementary binding of VGAM3602 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3602 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3602 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3602 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50394] It is appreciated that VGAM3602 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3602 host target genes. The mRNA of each one of this plurality of VGAM3602 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3602 RNA, herein designated VGAM RNA, and which when bound by VGAM3602 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3602 host target proteins.

[50395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3602 gene, herein designated VGAM GENE, on one or more VGAM3602 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50396] It is yet further appreciated that a function of VGAM3602 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3602 include diagnosis, prevention and

treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3602 correlate with, and may be deduced from, the identity of the host target genes which VGAM3602 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50397] Nucleotide sequences of the VGAM3602 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3602 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3602 are further described hereinbelow with reference to Table 1.

[50398] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3602 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50399] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3603 (VGAM3603) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50400] VGAM3603 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3603 was detected is described hereinabove with reference to Figs. 2–8.

[50401] VGAM3603 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3603 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50402] VGAM3603 gene, herein designated VGAM GENE, encodes a VGAM3603 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3603 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3603 precursor RNA is designated SEQ ID:81537, and is provided hereinbelow with reference to the sequence listing part.

[50403] VGAM3603 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3603 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50404] An enzyme complex designated DICER COMPLEX, dices the VGAM3603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3603 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3603 RNA is designated SEQ ID:81538, and is provided hereinbelow with reference to the sequence listing part.

[50405] VGAM3603 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3603 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3603 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50406] VGAM3603 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3603 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3603 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3603 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3603 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50407] The complementary binding of VGAM3603 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3603 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3603 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3603 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50408] It is appreciated that VGAM3603 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3603 host target genes. The mRNA of each one of this plurality of VGAM3603 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3603 RNA, herein designated VGAM RNA, and which when bound by VGAM3603 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3603 host target proteins.

[50409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3603 gene, herein designated VGAM GENE, on one or more VGAM3603 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50410] It is yet further appreciated that a function of VGAM3603 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3603 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific

functions, and accordingly utilities, of VGAM3603 correlate with, and may be deduced from, the identity of the host target genes which VGAM3603 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50411] Nucleotide sequences of the VGAM3603 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3603 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3603 are further described hereinbelow with reference to Table 1.

[50412] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3603 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50413] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3604 (VGAM3604) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[50414] VGAM3604 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3604 was detected is described hereinabove with reference to Figs. 2–8.

[50415] VGAM3604 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3604 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50416] VGAM3604 gene, herein designated VGAM GENE, encodes a VGAM3604 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3604 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3604 precursor RNA is designated SEQ ID:81540, and is provided hereinbelow with reference to the sequence listing part.

[50417] VGAM3604 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3604 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50418] An enzyme complex designated DICER COMPLEX, dices the VGAM3604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3604 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3604 RNA is designated SEQ ID:81541, and is provided hereinbelow with reference to the sequence listing part.

[50419] VGAM3604 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3604 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3604 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50420] VGAM3604 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3604 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3604 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3604 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3604 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50421] The complementary binding of VGAM3604 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3604 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3604 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3604 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50422] It is appreciated that VGAM3604 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3604 host target genes. The mRNA of each one of this plurality of VGAM3604 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3604 RNA, herein designated VGAM RNA, and which when bound by VGAM3604 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3604 host target proteins.

[50423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3604 gene, herein designated VGAM GENE, on one or more VGAM3604 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50424] It is yet further appreciated that a function of VGAM3604 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3604 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utili-

ties, of VGAM3604 correlate with, and may be deduced from, the identity of the host target genes which VGAM3604 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50425] Nucleotide sequences of the VGAM3604 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3604 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3604 are further described hereinbelow with reference to Table 1.

[50426] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3604 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50427] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3605 (VGAM3605) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[50428] VGAM3605 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3605 was detected is described hereinabove with reference to Figs. 2–8.

[50429] VGAM3605 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3605 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50430] VGAM3605 gene, herein designated VGAM GENE, encodes a VGAM3605 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3605 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3605 precursor RNA is designated SEQ ID:81567, and is provided hereinbelow with reference to the sequence listing part.

[50431] VGAM3605 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50432] An enzyme complex designated DICER COMPLEX, dices the VGAM3605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3605 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3605 RNA is designated SEQ ID:81568, and is provided hereinbelow with reference to the sequence listing part.

[50433] VGAM3605 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3605 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3605 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50434] VGAM3605 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3605 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3605 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3605 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3605 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50435] The complementary binding of VGAM3605 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3605 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3605 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3605 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50436] It is appreciated that VGAM3605 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3605 host target genes. The mRNA of each one of this plurality of VGAM3605 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3605 RNA, herein designated VGAM RNA, and which when bound by VGAM3605 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3605 host target proteins.

[50437] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3605 gene, herein designated VGAM GENE, on one or more VGAM3605 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50438] It is yet further appreciated that a function of VGAM3605 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3605 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3605 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3605 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50439] Nucleotide sequences of the VGAM3605 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3605 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3605 are further described hereinbelow with reference to Table 1.

[50440] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3605 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50441] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3606 (VGAM3606) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50442] VGAM3606 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3606 was detected is described hereinabove with reference to Figs. 2–8.

[50443] VGAM3606 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM3606 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50444] VGAM3606 gene, herein designated VGAM GENE, encodes a VGAM3606 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3606 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3606 precursor RNA is designated SEQ ID:81590, and is provided hereinbelow with reference to the sequence listing part.

[50445] VGAM3606 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50446] An enzyme complex designated DICER COMPLEX, dices the VGAM3606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3606 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3606 RNA is designated SEQ ID:81591, and is provided hereinbelow with reference to the sequence listing part.

[50447] VGAM3606 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3606 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3606 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50448] VGAM3606 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3606 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3606 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3606 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3606 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50449] The complementary binding of VGAM3606 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3606 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3606 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3606 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50450] It is appreciated that VGAM3606 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3606 host target genes. The mRNA of each one of this plurality of VGAM3606 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3606 RNA, herein designated VGAM RNA, and which when bound by VGAM3606 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3606 host target proteins.

[50451] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3606 gene, herein designated VGAM GENE, on one or more VGAM3606 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50452] It is yet further appreciated that a function of VGAM3606 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3606 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3606 correlate with, and may be deduced from, the identity of the host target genes which VGAM3606 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[50453] Nucleotide sequences of the VGAM3606 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3606 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3606 are further described hereinbelow with reference to Table 1.

[50454] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3606 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50455] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3607 (VGAM3607) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50456] VGAM3607 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3607 was detected is described hereinabove with reference to Figs. 2–8.

[50457] VGAM3607 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus.

VGAM3607 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50458] VGAM3607 gene, herein designated VGAM GENE, encodes a VGAM3607 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3607 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3607 precursor RNA is designated SEQ ID:81595, and is provided hereinbelow with reference to the sequence listing part.

[50459] VGAM3607 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50460] An enzyme complex designated DICER COMPLEX, dices the VGAM3607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3607 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3607 RNA is designated SEQ ID:81596, and is provided hereinbelow with reference to the sequence listing part.

[50461] VGAM3607 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3607 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3607 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50462] VGAM3607 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3607 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3607 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3607 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3607 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[50463] The complementary binding of VGAM3607 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3607 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3607 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3607 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50464] It is appreciated that VGAM3607 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3607 host target genes. The mRNA of each one of this plurality of VGAM3607 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3607 RNA, herein designated VGAM RNA, and which when bound by VGAM3607 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3607 host target proteins.

[50465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3607 gene, herein designated VGAM GENE, on one or more VGAM3607 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50466] It is yet further appreciated that a function of VGAM3607 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3607 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM3607 correlate with, and may be deduced from, the identity of the host target genes which VGAM3607 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[50467] Nucleotide sequences of the VGAM3607 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3607 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3607 are further described hereinbelow with reference to Table 1.

[50468] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3607 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50469] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3608 (VGAM3608) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50470] VGAM3608 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3608 was detected is described hereinabove with reference to Figs. 2–8.

[50471] VGAM3608 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3608 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50472] VGAM3608 gene, herein designated VGAM GENE, encodes a VGAM3608 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3608 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3608 precursor RNA is designated SEQ ID:81602, and is provided hereinbelow with reference to the sequence listing part.

[50473] VGAM3608 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50474] An enzyme complex designated DICER COMPLEX, dices the VGAM3608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3608 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3608 RNA is designated SEQ ID:81603, and is provided hereinbelow with reference to the sequence listing part.

[50475] VGAM3608 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3608 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3608 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[50476] VGAM3608 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3608 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3608 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3608 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3608 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50477] The complementary binding of VGAM3608 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3608 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3608 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3608 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50478] It is appreciated that VGAM3608 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3608 host target genes. The mRNA of each one of this plurality of VGAM3608 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3608 RNA, herein designated VGAM RNA, and which when bound by VGAM3608 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3608 host target proteins.

[50479] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3608 gene, herein designated VGAM GENE, on one

or more VGAM3608 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50480] It is yet further appreciated that a function of VGAM3608 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3608 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3608 correlate with, and may be deduced from, the identity of the host target genes which VGAM3608 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50481] Nucleotide sequences of the VGAM3608 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3608 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3608 are further described hereinbelow with reference to Table 1.

[50482] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3608 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50483] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3609 (VGAM3609) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50484] VGAM3609 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3609 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[50485] VGAM3609 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus.

VGAM3609 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50486] VGAM3609 gene, herein designated VGAM GENE, encodes a VGAM3609 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3609 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3609 precursor RNA is designated SEQ ID:81610, and is provided hereinbelow with reference to the sequence listing part.

[50487] VGAM3609 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50488] An enzyme complex designated DICER COMPLEX, dices the VGAM3609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3609 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3609 RNA is designated SEQ ID:81611, and is provided hereinbelow with reference to the sequence listing part.

[50489] VGAM3609 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3609 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3609 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50490] VGAM3609 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3609 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3609 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3609 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3609 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50491] The complementary binding of VGAM3609 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3609 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3609 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3609 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50492] It is appreciated that VGAM3609 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3609 host target genes. The mRNA of each one of this plurality of VGAM3609 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3609 RNA, herein designated VGAM RNA, and which when bound by VGAM3609 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3609 host target proteins.

[50493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3609 gene, herein designated VGAM GENE, on one or more VGAM3609 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50494] It is yet further appreciated that a function of VGAM3609 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3609 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3609 correlate with, and may be deduced from, the identity of the host target genes which VGAM3609 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50495] Nucleotide sequences of the VGAM3609 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3609 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3609 are further described hereinbelow with reference to Table 1.

[50496] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3609 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50497] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3610 (VGAM3610) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50498] VGAM3610 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3610 was detected is described hereinabove with reference to Figs. 2-8.

[50499] VGAM3610 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM3610 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50500] VGAM3610 gene, herein designated VGAM GENE, encodes a VGAM3610 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3610 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3610 precursor RNA is designated SEQ ID:81623, and is provided hereinbelow with reference to the sequence listing part.

[50501] VGAM3610 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50502] An enzyme complex designated DICER COMPLEX, dices the VGAM3610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3610 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3610 RNA is designated SEQ ID:81624, and is provided hereinbelow with reference to the sequence listing part.

[50503] VGAM3610 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3610 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3610 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50504] VGAM3610 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3610 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3610 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3610 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3610 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50505] The complementary binding of VGAM3610 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3610 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3610 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3610 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50506] It is appreciated that VGAM3610 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3610 host target genes. The mRNA of each one of this plurality of VGAM3610 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3610 RNA, herein designated VGAM RNA, and which when bound by VGAM3610 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3610 host target proteins.

[50507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3610 gene, herein designated VGAM GENE, on one or more VGAM3610 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50508] It is yet further appreciated that a function of VGAM3610 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3610 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM3610 correlate with, and may be deduced from, the identity of the host target genes which VGAM3610 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50509] Nucleotide sequences of the VGAM3610 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3610 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3610 are further described hereinbelow with reference to Table 1.

[50510] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3610 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50511] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3611 (VGAM3611) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50512] VGAM3611 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3611 was detected is described hereinabove with reference to Figs. 2-8.

[50513] VGAM3611 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3611 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50514] VGAM3611 gene, herein designated VGAM GENE, encodes a VGAM3611 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3611 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3611 precursor RNA is designated SEQ ID:81626, and is provided hereinbelow with reference to the sequence listing part.

[50515] VGAM3611 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50516] An enzyme complex designated DICER COMPLEX, dices

the VGAM3611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3611 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3611 RNA is designated SEQ ID:81627, and is provided hereinbelow with reference to the sequence listing part.

[50517] VGAM3611 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3611 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3611 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50518] VGAM3611 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3611 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3611 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3611 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3611 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50519] The complementary binding of VGAM3611 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3611 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3611 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3611 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50520] It is appreciated that VGAM3611 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3611 host target genes. The mRNA of each one of this plurality of VGAM3611 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3611 RNA, herein designated VGAM RNA, and which when bound by VGAM3611 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3611 host target proteins.

[50521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3611 gene, herein designated VGAM GENE, on one or more VGAM3611 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50522] It is yet further appreciated that a function of VGAM3611 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3611 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3611 correlate with, and may be deduced from, the identity of the host target genes which VGAM3611 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50523] Nucleotide sequences of the VGAM3611 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3611 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3611 are further described hereinbelow with reference to Table 1.

[50524] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3611 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50525] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3612 (VGAM3612) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50526] VGAM3612 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3612 was detected is described hereinabove with reference to Figs. 2-8.

[50527] VGAM3612 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM3612 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[50528] VGAM3612 gene, herein designated VGAM GENE, encodes a VGAM3612 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3612 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3612 precursor RNA is designated SEQ ID:81632, and is provided hereinbelow with reference to the sequence listing part.

[50529] VGAM3612 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50530] An enzyme complex designated DICER COMPLEX, dices the VGAM3612 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3612 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3612 RNA is designated SEQ ID:81633, and is provided hereinbelow with reference to the sequence listing part.

[50531] VGAM3612 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3612 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3612 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50532] VGAM3612 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3612 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3612 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3612 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3612 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50533] The complementary binding of VGAM3612 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3612 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3612

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3612 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50534] It is appreciated that VGAM3612 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3612 host target genes. The mRNA of each one of this plurality of VGAM3612 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3612 RNA, herein designated VGAM RNA, and which when bound by VGAM3612 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3612 host target proteins.

[50535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3612 gene, herein designated VGAM GENE, on one or more VGAM3612 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50536] It is yet further appreciated that a function of VGAM3612 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3612 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3612 correlate with, and may be deduced from, the identity of the host target genes which VGAM3612 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50537] Nucleotide sequences of the VGAM3612 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3612 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3612 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3612 are further described hereinbelow with reference to Table 1.

[50538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3612 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50539] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3613 (VGAM3613) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50540] VGAM3613 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3613 was detected is described hereinabove with reference to Figs. 2-8.

[50541] VGAM3613 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3613 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[50542] VGAM3613 gene, herein designated VGAM GENE, encodes a VGAM3613 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3613 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3613 precursor RNA is designated SEQ ID:81702, and is provided hereinbelow with reference to the sequence listing part.

[50543] VGAM3613 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50544] An enzyme complex designated DICER COMPLEX, dices the VGAM3613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3613 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3613 RNA is designated SEQ ID:81703, and is provided hereinbelow with reference to the sequence listing part.

[50545] VGAM3613 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3613 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3613 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50546] VGAM3613 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3613 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3613 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3613 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3613 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50547] The complementary binding of VGAM3613 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3613 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3613 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3613 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50548] It is appreciated that VGAM3613 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3613 host target genes. The mRNA of each one of this plurality of VGAM3613 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3613 RNA, herein designated VGAM RNA, and which when bound by VGAM3613 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3613 host target proteins.

[50549] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3613 gene, herein designated VGAM GENE, on one or more VGAM3613 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50550] It is yet further appreciated that a function of VGAM3613 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3613 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3613 correlate with, and may be deduced from, the identity of the host target genes which VGAM3613 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50551] Nucleotide sequences of the VGAM3613 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3613 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3613 are further

described hereinbelow with reference to Table 1.

[50552] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3613 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50553] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3614 (VGAM3614) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50554] VGAM3614 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3614 was detected is described hereinabove with reference to Figs. 2-8.

[50555] VGAM3614 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea mottle virus. VGAM3614 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50556] VGAM3614 gene, herein designated VGAM GENE, encodes a VGAM3614 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3614 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3614 precursor RNA is designated SEQ ID:81724, and is provided hereinbelow with reference to the sequence listing part.

[50557] VGAM3614 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50558] An enzyme complex designated DICER COMPLEX, dices the VGAM3614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3614 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3614 RNA is designated SEQ ID:81725, and is provided hereinbelow with reference to the sequence listing part.

[50559] VGAM3614 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3614 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3614 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50560] VGAM3614 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3614 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3614 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3614 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3614 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50561] The complementary binding of VGAM3614 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3614 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3614 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3614 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50562] It is appreciated that VGAM3614 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3614 host target genes. The mRNA of each one of this plurality of VGAM3614 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3614 RNA, herein designated VGAM RNA, and which when bound by VGAM3614 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3614 host target proteins.

[50563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3614 gene, herein designated VGAM GENE, on one or more VGAM3614 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50564] It is yet further appreciated that a function of VGAM3614 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3614 include diagnosis, prevention and treatment of viral infection by Cowpea mottle virus. Specific functions, and accordingly utilities, of VGAM3614 correlate with, and may be deduced from, the identity of the host target genes which VGAM3614 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50565] Nucleotide sequences of the VGAM3614 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3614 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3614 are further described hereinbelow with reference to Table 1.

[50566] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3614 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50567]

[50568] Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3615 (VGAM3615) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50569] VGAM3615 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3615 was detected is described hereinabove with reference to Figs. 2-8.

[50570] VGAM3615 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3615 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50571] VGAM3615 gene, herein designated VGAM GENE, encodes

a VGAM3615 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3615 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3615 precursor RNA is designated SEQ ID:81739, and is provided hereinbelow with reference to the sequence listing part.

[50572] VGAM3615 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50573] An enzyme complex designated DICER COMPLEX, dices the VGAM3615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3615 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3615 RNA is designated SEQ ID:81740, and is provided hereinbelow with reference to the sequence listing part.

[50574] VGAM3615 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3615 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3615 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50575] VGAM3615 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3615 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3615 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3615 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3615 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50576] The complementary binding of VGAM3615 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3615 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3615 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3615 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[50577] It is appreciated that VGAM3615 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3615 host target genes. The mRNA of each one of this plurality of VGAM3615 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3615 RNA, herein designated VGAM RNA, and which when bound by VGAM3615 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3615 host target proteins.

[50578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3615 gene, herein designated VGAM GENE, on one or more VGAM3615 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50579] It is yet further appreciated that a function of VGAM3615 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3615 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3615 correlate with, and may be deduced from, the identity of the host target genes which VGAM3615 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50580] Nucleotide sequences of the VGAM3615 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3615 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3615 are further described hereinbelow with reference to Table 1.

[50581] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3615 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50582] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3616 (VGAM3616) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50583] VGAM3616 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3616 was detected is described hereinabove with reference to Figs. 2-8.

[50584] VGAM3616 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3616 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50585] VGAM3616 gene, herein designated VGAM GENE, encodes a VGAM3616 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3616 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3616 precursor RNA is designated SEQ ID:81747, and is provided hereinbelow with reference to the sequence listing part.

[50586] VGAM3616 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50587] An enzyme complex designated DICER COMPLEX, dices the VGAM3616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3616 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3616 RNA is designated SEQ ID:81748, and is provided hereinbelow with reference to the sequence listing part.

[50588] VGAM3616 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3616 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3616 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50589] VGAM3616 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3616 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3616 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3616 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3616 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50590] The complementary binding of VGAM3616 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3616 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3616 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3616 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50591] It is appreciated that VGAM3616 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3616 host target genes. The mRNA of each one of this plurality of VGAM3616 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3616 RNA, herein designated VGAM RNA, and which when bound by VGAM3616 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3616 host target proteins.

[50592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3616 gene, herein designated VGAM GENE, on one or more VGAM3616 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50593] It is yet further appreciated that a function of VGAM3616 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3616 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3616 correlate with, and may be deduced from, the identity of the host target genes which VGAM3616 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50594] Nucleotide sequences of the VGAM3616 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3616 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3616 are further described hereinbelow with reference to Table 1.

[50595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3616 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50596] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3617 (VGAM3617) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50597] VGAM3617 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3617 was detected is described hereinabove with reference to Figs. 2-8.

[50598] VGAM3617 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Patchouli mild mosaic virus. VGAM3617 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50599] VGAM3617 gene, herein designated VGAM GENE, encodes a VGAM3617 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3617 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3617 precursor RNA is designated SEQ ID:81755, and is provided hereinbelow with reference to the sequence listing part.

[50600] VGAM3617 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50601] An enzyme complex designated DICER COMPLEX, dices the VGAM3617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3617 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3617 RNA is designated SEQ ID:81756, and is provided hereinbelow with reference to the sequence listing part.

[50602] VGAM3617 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3617 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3617 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50603] VGAM3617 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3617 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3617 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3617 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3617 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50604] The complementary binding of VGAM3617 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3617 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3617 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3617 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50605] It is appreciated that VGAM3617 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3617 host target genes. The mRNA of each one of this plurality of VGAM3617 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3617 RNA, herein designated VGAM RNA, and which when bound by VGAM3617 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3617 host target proteins.

[50606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3617 gene, herein designated VGAM GENE, on one or more VGAM3617 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50607] It is yet further appreciated that a function of VGAM3617 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3617 include diagnosis, prevention and treatment of viral infection by Patchouli mild mosaic virus. Specific functions, and accordingly utilities, of VGAM3617 correlate with, and may be deduced from, the identity of the host target genes which VGAM3617 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50608] Nucleotide sequences of the VGAM3617 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3617 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3617 are further described hereinbelow with reference to Table 1.

[50609] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3617 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50610] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3618 (VGAM3618) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50611] VGAM3618 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3618 was detected is described hereinabove with reference to Figs. 2–8.

[50612] VGAM3618 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3618 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50613] VGAM3618 gene, herein designated VGAM GENE, encodes a VGAM3618 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3618 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3618 precursor RNA is designated SEQ ID:81785, and is provided hereinbelow with reference to the sequence listing part.

[50614] VGAM3618 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50615] An enzyme complex designated DICER COMPLEX, dices the VGAM3618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3618 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3618 RNA is designated SEQ ID:81786, and is provided hereinbelow with reference to the sequence listing part.

[50616] VGAM3618 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3618 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3618 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50617] VGAM3618 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3618 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3618 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3618 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3618 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50618] The complementary binding of VGAM3618 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3618 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3618 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3618 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50619] It is appreciated that VGAM3618 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3618 host target genes. The mRNA of each one of this plurality of VGAM3618 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3618 RNA, herein designated VGAM RNA, and which when bound by VGAM3618 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3618 host target proteins.

[50620] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3618 gene, herein designated VGAM GENE, on one or more VGAM3618 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [50621] It is yet further appreciated that a function of VGAM3618 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3618 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3618 correlate with, and may be deduced from, the identity of the host target genes which VGAM3618 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [50622] Nucleotide sequences of the VGAM3618 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3618 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3618 are further described hereinbelow with reference to Table 1.
- [50623] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3618 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50624] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3619 (VGAM3619) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50625] VGAM3619 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3619 was detected is described hereinabove with reference to Figs. 2–8.

[50626] VGAM3619 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3619 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50627] VGAM3619 gene, herein designated VGAM GENE, encodes a VGAM3619 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3619 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3619 precursor RNA is designated SEQ ID:81800, and is provided hereinbelow with reference to the sequence listing part.

[50628] VGAM3619 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50629] An enzyme complex designated DICER COMPLEX, dices the VGAM3619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3619 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3619 RNA is designated SEQ ID:81801, and is provided hereinbelow with reference to the sequence listing part.

[50630] VGAM3619 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3619 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3619 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50631] VGAM3619 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3619 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3619 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3619 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3619 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50632] The complementary binding of VGAM3619 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3619 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3619 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3619 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50633] It is appreciated that VGAM3619 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3619 host target genes. The mRNA of

each one of this plurality of VGAM3619 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3619 RNA, herein designated VGAM RNA, and which when bound by VGAM3619 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3619 host target proteins.

[50634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3619 gene, herein designated VGAM GENE, on one or more VGAM3619 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[50635] It is yet further appreciated that a function of VGAM3619 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3619 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3619 correlate with, and may be deduced from, the identity of the host target genes which VGAM3619 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50636] Nucleotide sequences of the VGAM3619 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3619 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3619 are further described hereinbelow with reference to Table 1.

[50637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3619 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[50638] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3620 (VGAM3620) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50639] VGAM3620 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3620 was detected is described hereinabove with reference to Figs. 2–8.

[50640] VGAM3620 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3620 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50641] VGAM3620 gene, herein designated VGAM GENE, encodes a VGAM3620 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3620 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3620 precursor RNA is designated SEQ ID:81865, and is provided hereinbelow with reference to the sequence listing part.

[50642] VGAM3620 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50643] An enzyme complex designated DICER COMPLEX, dices the VGAM3620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3620 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3620 RNA is designated SEQ ID:81866,

and is provided hereinbelow with reference to the sequence listing part.

[50644] VGAM3620 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3620 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3620 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50645] VGAM3620 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3620 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3620 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3620 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3620 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50646] The complementary binding of VGAM3620 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3620 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3620 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3620 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50647] It is appreciated that VGAM3620 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3620 host target genes. The mRNA of each one of this plurality of VGAM3620 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3620 RNA, herein designated VGAM RNA, and which when bound by VGAM3620 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3620 host target proteins.

[50648] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3620 gene, herein designated VGAM GENE, on one or more VGAM3620 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50649] It is yet further appreciated that a function of VGAM3620 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3620 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3620 correlate with, and may be deduced from, the identity of the host target genes which VGAM3620 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50650] Nucleotide sequences of the VGAM3620 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3620 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3620 are further described hereinbelow with reference to Table 1.

[50651] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3620 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50652] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3621 (VGAM3621) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50653] VGAM3621 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3621 was detected is described hereinabove with reference to Figs. 2–8.

[50654] VGAM3621 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3621 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50655] VGAM3621 gene, herein designated VGAM GENE, encodes a VGAM3621 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3621 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3621 precursor

sor RNA is designated SEQ ID:81870, and is provided hereinbelow with reference to the sequence listing part.

[50656] VGAM3621 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50657] An enzyme complex designated DICER COMPLEX, dices the VGAM3621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3621 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3621 RNA is designated SEQ ID:81871, and is provided hereinbelow with reference to the se-

quence listing part.

[50658] VGAM3621 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3621 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3621 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50659] VGAM3621 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3621 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3621 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3621 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3621 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50660] The complementary binding of VGAM3621 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3621 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3621 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3621 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50661] It is appreciated that VGAM3621 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3621 host target genes. The mRNA of each one of this plurality of VGAM3621 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3621 RNA, herein designated VGAM RNA, and which when bound by VGAM3621 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3621 host target proteins.

[50662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3621 gene, herein designated VGAM GENE, on one or more VGAM3621 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50663] It is yet further appreciated that a function of VGAM3621

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3621 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3621 correlate with, and may be deduced from, the identity of the host target genes which VGAM3621 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50664] Nucleotide sequences of the VGAM3621 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3621 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3621 are further described hereinbelow with reference to Table 1.

[50665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3621 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50666] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3622 (VGAM3622) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50667] VGAM3622 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3622 was detected is described hereinabove with reference to Figs. 2–8.

[50668] VGAM3622 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Horseradish curly top virus. VGAM3622 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50669] VGAM3622 gene, herein designated VGAM GENE, encodes a VGAM3622 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3622 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3622 precursor RNA is designated SEQ ID:81951, and is provided

hereinbelow with reference to the sequence listing part.

[50670] VGAM3622 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50671] An enzyme complex designated DICER COMPLEX, dices the VGAM3622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3622 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3622 RNA is designated SEQ ID:81952, and is provided hereinbelow with reference to the sequence listing part.

[50672] VGAM3622 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3622 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3622 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50673] VGAM3622 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3622 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3622 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3622 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3622 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50674] The complementary binding of VGAM3622 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3622 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3622 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3622 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50675] It is appreciated that VGAM3622 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3622 host target genes. The mRNA of each one of this plurality of VGAM3622 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3622 RNA, herein designated VGAM RNA, and which when bound by VGAM3622 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3622 host target proteins.

[50676] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3622 gene, herein designated VGAM GENE, on one or more VGAM3622 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50677] It is yet further appreciated that a function of VGAM3622 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3622 include diagnosis, prevention and treatment of viral infection by Horseradish curly top virus. Specific functions, and accordingly utilities, of VGAM3622 correlate with, and may be deduced from, the identity of the host target genes which VGAM3622 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50678] Nucleotide sequences of the VGAM3622 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3622 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3622 are further described hereinbelow with reference to Table 1.

[50679] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3622 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50680] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3623 (VGAM3623) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50681] VGAM3623 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3623 was detected is described hereinabove with reference to Figs. 2–8.

[50682] VGAM3623 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious hematopoietic necrosis virus. VGAM3623 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50683] VGAM3623 gene, herein designated VGAM GENE, encodes a VGAM3623 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3623 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3623 precursor RNA is designated SEQ ID:81964, and is provided hereinbelow with reference to the sequence listing part.

[50684] VGAM3623 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50685] An enzyme complex designated DICER COMPLEX, dices the VGAM3623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3623 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3623 RNA is designated SEQ ID:81965, and is provided hereinbelow with reference to the sequence listing part.

[50686] VGAM3623 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3623 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3623 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50687] VGAM3623 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3623 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3623 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3623 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3623 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50688] The complementary binding of VGAM3623 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3623 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3623 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3623 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50689] It is appreciated that VGAM3623 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3623 host target genes. The mRNA of each one of this plurality of VGAM3623 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3623 RNA, herein designated VGAM

RNA, and which when bound by VGAM3623 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3623 host target proteins.

[50690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3623 gene, herein designated VGAM GENE, on one or more VGAM3623 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50691] It is yet further appreciated that a function of VGAM3623 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3623 include diagnosis, prevention and treatment of viral infection by Infectious hematopoietic necrosis virus. Specific functions, and accordingly utilities, of VGAM3623 correlate with, and may be deduced from, the identity of the host target genes which VGAM3623 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50692] Nucleotide sequences of the VGAM3623 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3623 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3623 are further described hereinbelow with reference to Table 1.

[50693] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3623 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50694] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3624 (VGAM3624) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50695] VGAM3624 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3624 was detected is described hereinabove with reference to Figs. 2-8.

[50696] VGAM3624 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3624 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50697] VGAM3624 gene, herein designated VGAM GENE, encodes a VGAM3624 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3624 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3624 precursor RNA is designated SEQ ID:82023, and is provided hereinbelow with reference to the sequence listing part.

[50698] VGAM3624 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50699] An enzyme complex designated DICER COMPLEX, dices the VGAM3624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3624 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3624 RNA is designated SEQ ID:82024, and is provided hereinbelow with reference to the sequence listing part.

[50700] VGAM3624 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3624 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3624 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50701] VGAM3624 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3624 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3624 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3624 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3624 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50702] The complementary binding of VGAM3624 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3624 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3624 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3624 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50703] It is appreciated that VGAM3624 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3624 host target genes. The mRNA of each one of this plurality of VGAM3624 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3624 RNA, herein designated VGAM RNA, and which when bound by VGAM3624 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3624 host target proteins.

[50704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3624 gene, herein designated VGAM GENE, on one or more VGAM3624 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50705] It is yet further appreciated that a function of VGAM3624 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3624 include diagnosis, prevention and

treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3624 correlate with, and may be deduced from, the identity of the host target genes which VGAM3624 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50706] Nucleotide sequences of the VGAM3624 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3624 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3624 are further described hereinbelow with reference to Table 1.

[50707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3624 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50708] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3625 (VGAM3625) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50709] VGAM3625 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3625 was detected is described hereinabove with reference to Figs. 2–8.

[50710] VGAM3625 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato leafroll virus. VGAM3625 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50711] VGAM3625 gene, herein designated VGAM GENE, encodes a VGAM3625 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3625 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3625 precursor RNA is designated SEQ ID:82029, and is provided hereinbelow with reference to the sequence listing part.

[50712] VGAM3625 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3625 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50713] An enzyme complex designated DICER COMPLEX, dices the VGAM3625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3625 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3625 RNA is designated SEQ ID:82030, and is provided hereinbelow with reference to the sequence listing part.

[50714] VGAM3625 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3625 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3625 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50715] VGAM3625 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3625 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3625 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3625 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3625 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50716] The complementary binding of VGAM3625 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3625 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3625 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3625 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50717] It is appreciated that VGAM3625 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3625 host target genes. The mRNA of each one of this plurality of VGAM3625 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3625 RNA, herein designated VGAM RNA, and which when bound by VGAM3625 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3625 host target proteins.

[50718] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3625 gene, herein designated VGAM GENE, on one or more VGAM3625 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50719] It is yet further appreciated that a function of VGAM3625 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3625 include diagnosis, prevention and treatment of viral infection by Potato leafroll virus. Specific

functions, and accordingly utilities, of VGAM3625 correlate with, and may be deduced from, the identity of the host target genes which VGAM3625 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50720] Nucleotide sequences of the VGAM3625 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3625 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3625 are further described hereinbelow with reference to Table 1.

[50721] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3625 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50722] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3626 (VGAM3626) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[50723] VGAM3626 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3626 was detected is described hereinabove with reference to Figs. 2–8.

[50724] VGAM3626 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3626 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50725] VGAM3626 gene, herein designated VGAM GENE, encodes a VGAM3626 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3626 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3626 precursor RNA is designated SEQ ID:82043, and is provided hereinbelow with reference to the sequence listing part.

[50726] VGAM3626 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3626 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50727] An enzyme complex designated DICER COMPLEX, dices the VGAM3626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3626 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3626 RNA is designated SEQ ID:82044, and is provided hereinbelow with reference to the sequence listing part.

[50728] VGAM3626 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3626 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3626 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50729] VGAM3626 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3626 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3626 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3626 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3626 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50730] The complementary binding of VGAM3626 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3626 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3626 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3626 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50731] It is appreciated that VGAM3626 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3626 host target genes. The mRNA of each one of this plurality of VGAM3626 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3626 RNA, herein designated VGAM RNA, and which when bound by VGAM3626 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3626 host target proteins.

[50732] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3626 gene, herein designated VGAM GENE, on one or more VGAM3626 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50733] It is yet further appreciated that a function of VGAM3626 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3626 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3626 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM3626 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50734] Nucleotide sequences of the VGAM3626 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3626 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3626 are further described hereinbelow with reference to Table 1.

[50735] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3626 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50736] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3627 (VGAM3627) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[50737] VGAM3627 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3627 was detected is described hereinabove with reference to Figs. 2–8.

[50738] VGAM3627 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM3627 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50739] VGAM3627 gene, herein designated VGAM GENE, encodes a VGAM3627 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3627 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3627 precursor RNA is designated SEQ ID:82053, and is provided hereinbelow with reference to the sequence listing part.

[50740] VGAM3627 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50741] An enzyme complex designated DICER COMPLEX, dices the VGAM3627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3627 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3627 RNA is designated SEQ ID:82054, and is provided hereinbelow with reference to the sequence listing part.

[50742] VGAM3627 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3627 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3627 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50743] VGAM3627 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3627 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3627 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3627 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3627 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50744] The complementary binding of VGAM3627 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3627 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3627 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3627 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50745] It is appreciated that VGAM3627 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3627 host target genes. The mRNA of each one of this plurality of VGAM3627 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3627 RNA, herein designated VGAM RNA, and which when bound by VGAM3627 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3627 host target proteins.

[50746] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3627 gene, herein designated VGAM GENE, on one or more VGAM3627 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50747] It is yet further appreciated that a function of VGAM3627 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3627 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM3627 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3627 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50748] Nucleotide sequences of the VGAM3627 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3627 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3627 are further described hereinbelow with reference to Table 1.

[50749] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3627 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50750] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3628 (VGAM3628) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50751] VGAM3628 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3628 was detected is described hereinabove with reference to Figs. 2–8.

[50752] VGAM3628 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine papillomavirus. VGAM3628 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50753] VGAM3628 gene, herein designated VGAM GENE, encodes a VGAM3628 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3628 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3628 precursor RNA is designated SEQ ID:82062, and is provided hereinbelow with reference to the sequence listing part.

[50754] VGAM3628 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50755] An enzyme complex designated DICER COMPLEX, dices the VGAM3628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3628 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3628 RNA is designated SEQ ID:82063, and is provided hereinbelow with reference to the sequence listing part.

[50756] VGAM3628 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3628 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3628 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50757] VGAM3628 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3628 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3628 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3628 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3628 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50758] The complementary binding of VGAM3628 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3628 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3628 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3628 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50759] It is appreciated that VGAM3628 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3628 host target genes. The mRNA of each one of this plurality of VGAM3628 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3628 RNA, herein designated VGAM RNA, and which when bound by VGAM3628 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3628 host target proteins.

[50760] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3628 gene, herein designated VGAM GENE, on one or more VGAM3628 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50761] It is yet further appreciated that a function of VGAM3628 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3628 include diagnosis, prevention and treatment of viral infection by Bovine papillomavirus. Specific functions, and accordingly utilities, of VGAM3628 correlate with, and may be deduced from, the identity of the host target genes which VGAM3628 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[50762] Nucleotide sequences of the VGAM3628 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3628 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3628 are further described hereinbelow with reference to Table 1.

[50763] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3628 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50764] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3629 (VGAM3629) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50765] VGAM3629 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3629 was detected is described hereinabove with reference to Figs. 2–8.

[50766] VGAM3629 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mumps virus.

VGAM3629 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50767] VGAM3629 gene, herein designated VGAM GENE, encodes a VGAM3629 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3629 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3629 precursor RNA is designated SEQ ID:82070, and is provided hereinbelow with reference to the sequence listing part.

[50768] VGAM3629 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50769] An enzyme complex designated DICER COMPLEX, dices the VGAM3629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3629 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3629 RNA is designated SEQ ID:82071, and is provided hereinbelow with reference to the sequence listing part.

[50770] VGAM3629 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3629 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3629 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50771] VGAM3629 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3629 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3629 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3629 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3629 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[50772] The complementary binding of VGAM3629 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3629 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3629 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3629 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50773] It is appreciated that VGAM3629 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3629 host target genes. The mRNA of each one of this plurality of VGAM3629 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3629 RNA, herein designated VGAM RNA, and which when bound by VGAM3629 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3629 host target proteins.

[50774] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3629 gene, herein designated VGAM GENE, on one or more VGAM3629 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50775] It is yet further appreciated that a function of VGAM3629 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3629 include diagnosis, prevention and treatment of viral infection by Mumps virus. Specific functions, and accordingly utilities, of VGAM3629 correlate with, and may be deduced from, the identity of the host target genes which VGAM3629 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[50776] Nucleotide sequences of the VGAM3629 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3629 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3629 are further described hereinbelow with reference to Table 1.

[50777] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3629 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50778] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3630 (VGAM3630) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50779] VGAM3630 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3630 was detected is described hereinabove with reference to Figs. 2–8.

[50780] VGAM3630 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3630 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50781] VGAM3630 gene, herein designated VGAM GENE, encodes a VGAM3630 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3630 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3630 precursor RNA is designated SEQ ID:82092, and is provided hereinbelow with reference to the sequence listing part.

[50782] VGAM3630 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50783] An enzyme complex designated DICER COMPLEX, dices the VGAM3630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3630 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3630 RNA is designated SEQ ID:82093, and is provided hereinbelow with reference to the sequence listing part.

[50784] VGAM3630 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3630 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3630 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[50785] VGAM3630 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3630 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3630 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3630 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3630 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50786] The complementary binding of VGAM3630 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3630 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3630 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3630 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50787] It is appreciated that VGAM3630 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3630 host target genes. The mRNA of each one of this plurality of VGAM3630 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3630 RNA, herein designated VGAM RNA, and which when bound by VGAM3630 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3630 host target proteins.

[50788] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3630 gene, herein designated VGAM GENE, on one

or more VGAM3630 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50789] It is yet further appreciated that a function of VGAM3630 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3630 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3630 correlate with, and may be deduced from, the identity of the host target genes which VGAM3630 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50790] Nucleotide sequences of the VGAM3630 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3630 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3630 are further described hereinbelow with reference to Table 1.

[50791] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3630 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50792] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3631 (VGAM3631) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50793] VGAM3631 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3631 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[50794] VGAM3631 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3631 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50795] VGAM3631 gene, herein designated VGAM GENE, encodes a VGAM3631 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3631 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3631 precursor RNA is designated SEQ ID:82124, and is provided hereinbelow with reference to the sequence listing part.

[50796] VGAM3631 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50797] An enzyme complex designated DICER COMPLEX, dices the VGAM3631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3631 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3631 RNA is designated SEQ ID:82125, and is provided hereinbelow with reference to the sequence listing part.

[50798] VGAM3631 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3631 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3631 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50799] VGAM3631 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3631 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3631 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3631 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3631 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50800] The complementary binding of VGAM3631 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3631 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3631 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3631 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50801] It is appreciated that VGAM3631 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3631 host target genes. The mRNA of each one of this plurality of VGAM3631 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3631 RNA, herein designated VGAM RNA, and which when bound by VGAM3631 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3631 host target proteins.

[50802] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3631 gene, herein designated VGAM GENE, on one or more VGAM3631 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50803] It is yet further appreciated that a function of VGAM3631 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3631 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3631 correlate with, and may be deduced from, the identity of the host target genes which VGAM3631 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50804] Nucleotide sequences of the VGAM3631 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3631 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3631 are further described hereinbelow with reference to Table 1.

[50805] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3631 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50806] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3632 (VGAM3632) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50807] VGAM3632 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3632 was detected is described hereinabove with reference to Figs. 2-8.

[50808] VGAM3632 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid herpesvirus 1. VGAM3632 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50809] VGAM3632 gene, herein designated VGAM GENE, encodes a VGAM3632 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3632 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3632 precursor RNA is designated SEQ ID:82134, and is provided hereinbelow with reference to the sequence listing part.

[50810] VGAM3632 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[50811] An enzyme complex designated DICER COMPLEX, dices the VGAM3632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3632 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3632 RNA is designated SEQ ID:82135, and is provided hereinbelow with reference to the sequence listing part.

[50812] VGAM3632 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3632 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3632 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50813] VGAM3632 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3632 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3632 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3632 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3632 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50814] The complementary binding of VGAM3632 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3632 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3632 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3632 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50815] It is appreciated that VGAM3632 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3632 host target genes. The mRNA of each one of this plurality of VGAM3632 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3632 RNA, herein designated VGAM RNA, and which when bound by VGAM3632 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3632 host target proteins.

[50816] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3632 gene, herein designated VGAM GENE, on one or more VGAM3632 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50817] It is yet further appreciated that a function of VGAM3632 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3632 include diagnosis, prevention and treatment of viral infection by Ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3632 correlate with, and may be deduced from, the identity of the host target genes which VGAM3632 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50818] Nucleotide sequences of the VGAM3632 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3632 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3632 are further described hereinbelow with reference to Table 1.

[50819] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3632 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50820] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3633 (VGAM3633) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50821] VGAM3633 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3633 was detected is described hereinabove with reference to Figs. 2-8.

[50822] VGAM3633 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus.

VGAM3633 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50823] VGAM3633 gene, herein designated VGAM GENE, encodes a VGAM3633 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3633 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3633 precursor RNA is designated SEQ ID:82139, and is provided hereinbelow with reference to the sequence listing part.

[50824] VGAM3633 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50825] An enzyme complex designated DICER COMPLEX, dices the VGAM3633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3633 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3633 RNA is designated SEQ ID:82140, and is provided hereinbelow with reference to the sequence listing part.

[50826] VGAM3633 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3633 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3633 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50827] VGAM3633 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3633 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3633 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3633 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3633 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50828] The complementary binding of VGAM3633 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3633 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3633 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3633 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50829] It is appreciated that VGAM3633 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3633 host target genes. The mRNA of each one of this plurality of VGAM3633 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3633 RNA, herein designated VGAM RNA, and which when bound by VGAM3633 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3633 host target proteins.

[50830] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3633 gene, herein designated VGAM GENE, on one or more VGAM3633 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50831] It is yet further appreciated that a function of VGAM3633 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3633 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3633 correlate with, and may be deduced from, the identity of the host target genes which VGAM3633 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50832] Nucleotide sequences of the VGAM3633 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3633 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3633 are further described hereinbelow with reference to Table 1.

[50833] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3633 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50834] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3634 (VGAM3634) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50835] VGAM3634 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3634 was detected is described hereinabove with reference to Figs. 2-8.

[50836] VGAM3634 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3634 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50837] VGAM3634 gene, herein designated VGAM GENE, encodes a VGAM3634 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3634 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3634 precursor RNA is designated SEQ ID:82143, and is provided hereinbelow with reference to the sequence listing part.

[50838] VGAM3634 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50839] An enzyme complex designated DICER COMPLEX, dices

the VGAM3634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3634 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3634 RNA is designated SEQ ID:82144, and is provided hereinbelow with reference to the sequence listing part.

[50840] VGAM3634 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3634 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3634 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50841] VGAM3634 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3634 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3634 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3634 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3634 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50842] The complementary binding of VGAM3634 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3634 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3634 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3634 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50843] It is appreciated that VGAM3634 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3634 host target genes. The mRNA of each one of this plurality of VGAM3634 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3634 RNA, herein designated VGAM RNA, and which when bound by VGAM3634 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3634 host target proteins.

[50844] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3634 gene, herein designated VGAM GENE, on one or more VGAM3634 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50845] It is yet further appreciated that a function of VGAM3634 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3634 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3634 correlate with, and may be deduced from, the identity of the host target genes which VGAM3634 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50846] Nucleotide sequences of the VGAM3634 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3634 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3634 are further described hereinbelow with reference to Table 1.

[50847] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3634 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50848] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3635 (VGAM3635) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50849] VGAM3635 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3635 was detected is described hereinabove with reference to Figs. 2-8.

[50850] VGAM3635 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3635 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50851] VGAM3635 gene, herein designated VGAM GENE, encodes a VGAM3635 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3635 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3635 precursor RNA is designated SEQ ID:82149, and is provided hereinbelow with reference to the sequence listing part.

[50852] VGAM3635 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50853] An enzyme complex designated DICER COMPLEX, dices the VGAM3635 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3635 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3635 RNA is designated SEQ ID:82150, and is provided hereinbelow with reference to the sequence listing part.

[50854] VGAM3635 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3635 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3635 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50855] VGAM3635 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3635 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3635 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3635 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3635 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50856] The complementary binding of VGAM3635 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3635 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3635

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3635 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50857] It is appreciated that VGAM3635 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3635 host target genes. The mRNA of each one of this plurality of VGAM3635 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3635 RNA, herein designated VGAM RNA, and which when bound by VGAM3635 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3635 host target proteins.

[50858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3635 gene, herein designated VGAM GENE, on one or more VGAM3635 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50859] It is yet further appreciated that a function of VGAM3635 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3635 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3635 correlate with, and may be deduced from, the identity of the host target genes which VGAM3635 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50860] Nucleotide sequences of the VGAM3635 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3635 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3635 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3635 are further described hereinbelow with reference to Table 1.

[50861] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3635 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50862] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3636 (VGAM3636) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50863] VGAM3636 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3636 was detected is described hereinabove with reference to Figs. 2-8.

[50864] VGAM3636 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3636 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[50865] VGAM3636 gene, herein designated VGAM GENE, encodes a VGAM3636 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3636 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3636 precursor RNA is designated SEQ ID:82154, and is provided hereinbelow with reference to the sequence listing part.

[50866] VGAM3636 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50867] An enzyme complex designated DICER COMPLEX, dices the VGAM3636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3636 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3636 RNA is designated SEQ ID:82155, and is provided hereinbelow with reference to the sequence listing part.

[50868] VGAM3636 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3636 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3636 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50869] VGAM3636 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3636 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3636 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3636 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3636 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50870] The complementary binding of VGAM3636 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3636 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3636 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3636 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50871] It is appreciated that VGAM3636 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3636 host target genes. The mRNA of each one of this plurality of VGAM3636 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3636 RNA, herein designated VGAM RNA, and which when bound by VGAM3636 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3636 host target proteins.

[50872] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3636 gene, herein designated VGAM GENE, on one or more VGAM3636 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50873] It is yet further appreciated that a function of VGAM3636 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3636 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3636 correlate with, and may be deduced from, the identity of the host target genes which VGAM3636 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50874] Nucleotide sequences of the VGAM3636 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3636 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3636 are further

described hereinbelow with reference to Table 1.

[50875] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3636 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50876] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3637 (VGAM3637) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50877] VGAM3637 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3637 was detected is described hereinabove with reference to Figs. 2-8.

[50878] VGAM3637 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM3637 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50879] VGAM3637 gene, herein designated VGAM GENE, encodes a VGAM3637 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3637 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3637 precursor RNA is designated SEQ ID:82167, and is provided hereinbelow with reference to the sequence listing part.

[50880] VGAM3637 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50881] An enzyme complex designated DICER COMPLEX, dices the VGAM3637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3637 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3637 RNA is designated SEQ ID:82168, and is provided hereinbelow with reference to the sequence listing part.

[50882] VGAM3637 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3637 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3637 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50883] VGAM3637 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3637 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3637 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3637 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3637 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50884] The complementary binding of VGAM3637 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3637 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3637 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3637 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50885] It is appreciated that VGAM3637 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3637 host target genes. The mRNA of each one of this plurality of VGAM3637 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3637 RNA, herein designated VGAM RNA, and which when bound by VGAM3637 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3637 host target proteins.

[50886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3637 gene, herein designated VGAM GENE, on one or more VGAM3637 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50887] It is yet further appreciated that a function of VGAM3637 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3637 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM3637 correlate with, and may be deduced from, the identity of the host target genes which VGAM3637 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50888] Nucleotide sequences of the VGAM3637 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3637 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3637 are further described hereinbelow with reference to Table 1.

[50889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3637 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50890] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3638 (VGAM3638) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50891] VGAM3638 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3638 was detected is described hereinabove with reference to Figs. 2-8.

[50892] VGAM3638 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM3638 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50893] VGAM3638 gene, herein designated VGAM GENE, encodes

a VGAM3638 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3638 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3638 precursor RNA is designated SEQ ID:82175, and is provided hereinbelow with reference to the sequence listing part.

[50894] VGAM3638 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50895] An enzyme complex designated DICER COMPLEX, dices the VGAM3638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3638 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3638 RNA is designated SEQ ID:82176, and is provided hereinbelow with reference to the sequence listing part.

[50896] VGAM3638 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3638 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3638 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50897] VGAM3638 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3638 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3638 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3638 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3638 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50898] The complementary binding of VGAM3638 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3638 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3638 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3638 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[50899] It is appreciated that VGAM3638 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3638 host target genes. The mRNA of each one of this plurality of VGAM3638 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3638 RNA, herein designated VGAM RNA, and which when bound by VGAM3638 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3638 host target proteins.

[50900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3638 gene, herein designated VGAM GENE, on one or more VGAM3638 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50901] It is yet further appreciated that a function of VGAM3638 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3638 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM3638 correlate with, and may be deduced from, the identity of the host target genes which VGAM3638 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50902] Nucleotide sequences of the VGAM3638 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3638 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3638 are further described hereinbelow with reference to Table 1.

[50903] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3638 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50904] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3639 (VGAM3639) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50905] VGAM3639 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3639 was detected is described hereinabove with reference to Figs. 2-8.

[50906] VGAM3639 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3639 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50907] VGAM3639 gene, herein designated VGAM GENE, encodes a VGAM3639 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3639 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3639 precursor RNA is designated SEQ ID:82182, and is provided hereinbelow with reference to the sequence listing part.

[50908] VGAM3639 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50909] An enzyme complex designated DICER COMPLEX, dices the VGAM3639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3639 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3639 RNA is designated SEQ ID:82183, and is provided hereinbelow with reference to the sequence listing part.

[50910] VGAM3639 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3639 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3639 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50911] VGAM3639 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3639 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3639 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3639 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3639 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50912] The complementary binding of VGAM3639 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3639 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3639 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3639 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50913] It is appreciated that VGAM3639 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3639 host target genes. The mRNA of each one of this plurality of VGAM3639 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3639 RNA, herein designated VGAM RNA, and which when bound by VGAM3639 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3639 host target proteins.

[50914] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3639 gene, herein designated VGAM GENE, on one or more VGAM3639 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50915] It is yet further appreciated that a function of VGAM3639 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3639 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3639 correlate with, and may be deduced from, the identity of the host target genes which VGAM3639 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50916] Nucleotide sequences of the VGAM3639 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3639 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3639 are further described hereinbelow with reference to Table 1.

[50917] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3639 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50918] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3640 (VGAM3640) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50919] VGAM3640 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3640 was detected is described hereinabove with reference to Figs. 2-8.

[50920] VGAM3640 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Impatiens necrotic spot virus. VGAM3640 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50921] VGAM3640 gene, herein designated VGAM GENE, encodes a VGAM3640 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3640 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3640 precursor RNA is designated SEQ ID:82231, and is provided hereinbelow with reference to the sequence listing part.

[50922] VGAM3640 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50923] An enzyme complex designated DICER COMPLEX, dices the VGAM3640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3640 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3640 RNA is designated SEQ ID:82232, and is provided hereinbelow with reference to the sequence listing part.

[50924] VGAM3640 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3640 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3640 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50925] VGAM3640 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3640 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3640 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3640 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3640 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50926] The complementary binding of VGAM3640 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3640 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3640 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3640 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50927] It is appreciated that VGAM3640 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3640 host target genes. The mRNA of each one of this plurality of VGAM3640 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3640 RNA, herein designated VGAM RNA, and which when bound by VGAM3640 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3640 host target proteins.

[50928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3640 gene, herein designated VGAM GENE, on one or more VGAM3640 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50929] It is yet further appreciated that a function of VGAM3640 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3640 include diagnosis, prevention and treatment of viral infection by Impatiens necrotic spot virus. Specific functions, and accordingly utilities, of VGAM3640 correlate with, and may be deduced from, the identity of the host target genes which VGAM3640 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50930] Nucleotide sequences of the VGAM3640 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3640 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3640 are further described hereinbelow with reference to Table 1.

[50931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3640 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50932] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3641 (VGAM3641) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50933] VGAM3641 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3641 was detected is described hereinabove with reference to Figs. 2–8.

[50934] VGAM3641 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3641 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50935] VGAM3641 gene, herein designated VGAM GENE, encodes a VGAM3641 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3641 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3641 precursor RNA is designated SEQ ID:82236, and is provided hereinbelow with reference to the sequence listing part.

[50936] VGAM3641 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50937] An enzyme complex designated DICER COMPLEX, dices the VGAM3641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3641 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3641 RNA is designated SEQ ID:82237, and is provided hereinbelow with reference to the sequence listing part.

[50938] VGAM3641 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3641 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3641 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50939] VGAM3641 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3641 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3641 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3641 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3641 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50940] The complementary binding of VGAM3641 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3641 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3641 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3641 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50941] It is appreciated that VGAM3641 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3641 host target genes. The mRNA of each one of this plurality of VGAM3641 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3641 RNA, herein designated VGAM RNA, and which when bound by VGAM3641 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3641 host target proteins.

[50942] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3641 gene, herein designated VGAM GENE, on one or more VGAM3641 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[50943] It is yet further appreciated that a function of VGAM3641 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3641 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3641 correlate with, and may be deduced from, the identity of the host target genes which VGAM3641 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50944] Nucleotide sequences of the VGAM3641 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3641 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3641 are further described hereinbelow with reference to Table 1.

[50945] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3641 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50946] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3642 (VGAM3642) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50947] VGAM3642 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3642 was detected is described hereinabove with reference to Figs. 2-8.

[50948] VGAM3642 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-1. VGAM3642 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50949] VGAM3642 gene, herein designated VGAM GENE, encodes a VGAM3642 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3642 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3642 precursor RNA is designated SEQ ID:82260, and is provided hereinbelow with reference to the sequence listing part.

[50950] VGAM3642 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50951] An enzyme complex designated DICER COMPLEX, dices the VGAM3642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3642 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3642 RNA is designated SEQ ID:82261, and is provided hereinbelow with reference to the sequence listing part.

[50952] VGAM3642 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3642 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3642 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50953] VGAM3642 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3642 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3642 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3642 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3642 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50954] The complementary binding of VGAM3642 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3642 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3642 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3642 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50955] It is appreciated that VGAM3642 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3642 host target genes. The mRNA of

each one of this plurality of VGAM3642 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3642 RNA, herein designated VGAM RNA, and which when bound by VGAM3642 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3642 host target proteins.

[50956] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3642 gene, herein designated VGAM GENE, on one or more VGAM3642 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[50957] It is yet further appreciated that a function of VGAM3642 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3642 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM3642 correlate with, and may be deduced from, the identity of the host target genes which VGAM3642 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50958] Nucleotide sequences of the VGAM3642 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3642 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3642 are further described hereinbelow with reference to Table 1.

[50959] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3642 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[50960] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3643 (VGAM3643) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50961] VGAM3643 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3643 was detected is described hereinabove with reference to Figs. 2–8.

[50962] VGAM3643 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM3643 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50963] VGAM3643 gene, herein designated VGAM GENE, encodes a VGAM3643 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3643 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3643 precursor RNA is designated SEQ ID:82271, and is provided hereinbelow with reference to the sequence listing part.

[50964] VGAM3643 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50965] An enzyme complex designated DICER COMPLEX, dices the VGAM3643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3643 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3643 RNA is designated SEQ ID:82272,

and is provided hereinbelow with reference to the sequence listing part.

[50966] VGAM3643 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3643 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3643 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50967] VGAM3643 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3643 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3643 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3643 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3643 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50968] The complementary binding of VGAM3643 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3643 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3643 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3643 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50969] It is appreciated that VGAM3643 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3643 host target genes. The mRNA of each one of this plurality of VGAM3643 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3643 RNA, herein designated VGAM RNA, and which when bound by VGAM3643 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3643 host target proteins.

[50970] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3643 gene, herein designated VGAM GENE, on one or more VGAM3643 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50971] It is yet further appreciated that a function of VGAM3643 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3643 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM3643 correlate with, and may be deduced from, the identity of the host target genes which VGAM3643 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50972] Nucleotide sequences of the VGAM3643 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3643 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3643 are further described hereinbelow with reference to Table 1.

[50973] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3643 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50974] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3644 (VGAM3644) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50975] VGAM3644 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3644 was detected is described hereinabove with reference to Figs. 2-8.

[50976] VGAM3644 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine reproductive and respiratory syndrome virus. VGAM3644 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50977] VGAM3644 gene, herein designated VGAM GENE, encodes a VGAM3644 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3644 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3644 precursor RNA is designated SEQ ID:82317, and is provided hereinbelow with reference to the sequence listing part.

[50978] VGAM3644 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50979] An enzyme complex designated DICER COMPLEX, dices the VGAM3644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3644 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3644 RNA is designated SEQ ID:82318, and is provided hereinbelow with reference to the sequence listing part.

[50980] VGAM3644 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3644 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3644 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50981] VGAM3644 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3644 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3644 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3644 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3644 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50982] The complementary binding of VGAM3644 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3644 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3644 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3644 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50983] It is appreciated that VGAM3644 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3644 host target genes. The mRNA of each one of this plurality of VGAM3644 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3644 RNA, herein designated VGAM RNA, and which when bound by VGAM3644 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3644 host target proteins.

[50984] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3644 gene, herein designated VGAM GENE, on one or more VGAM3644 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50985] It is yet further appreciated that a function of VGAM3644 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3644 include diagnosis, prevention and treatment of viral infection by Porcine reproductive and respiratory syndrome virus. Specific functions, and accordingly utilities, of VGAM3644 correlate with, and may be deduced from, the identity of the host target genes which VGAM3644 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50986] Nucleotide sequences of the VGAM3644 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3644 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3644 are further described hereinbelow with reference to Table 1.

[50987] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3644 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50988] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3645 (VGAM3645) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50989] VGAM3645 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3645 was detected is described hereinabove with reference to Figs. 2–8.

[50990] VGAM3645 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine reproductive and respiratory syndrome virus. VGAM3645 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50991] VGAM3645 gene, herein designated VGAM GENE, encodes a VGAM3645 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3645 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3645 precursor RNA is designated SEQ ID:82387, and is provided hereinbelow with reference to the sequence listing part.

[50992] VGAM3645 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50993] An enzyme complex designated DICER COMPLEX, dices the VGAM3645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3645 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3645 RNA is designated SEQ ID:82388, and is provided hereinbelow with reference to the sequence listing part.

[50994] VGAM3645 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3645 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3645 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50995] VGAM3645 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3645 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3645 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3645 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3645 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50996] The complementary binding of VGAM3645 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3645 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3645 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3645 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50997] It is appreciated that VGAM3645 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3645 host target genes. The mRNA of each one of this plurality of VGAM3645 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3645 RNA, herein designated VGAM RNA, and which when bound by VGAM3645 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3645 host target proteins.

[50998] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3645 gene, herein designated VGAM GENE, on one or more VGAM3645 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [50999] It is yet further appreciated that a function of VGAM3645 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3645 include diagnosis, prevention and treatment of viral infection by Porcine reproductive and respiratory syndrome virus. Specific functions, and accordingly utilities, of VGAM3645 correlate with, and may be deduced from, the identity of the host target genes which VGAM3645 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [51000] Nucleotide sequences of the VGAM3645 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3645 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3645 are further described hereinbelow with reference to Table 1.
- [51001] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3645 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51002] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3646 (VGAM3646) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51003] VGAM3646 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3646 was detected is described hereinabove with reference to Figs. 2-8.

[51004] VGAM3646 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3646 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51005] VGAM3646 gene, herein designated VGAM GENE, encodes a VGAM3646 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3646 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3646 precursor RNA is designated SEQ ID:82420, and is provided hereinbelow with reference to the sequence listing part.

[51006] VGAM3646 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51007] An enzyme complex designated DICER COMPLEX, dices the VGAM3646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3646 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3646 RNA is designated SEQ ID:82421, and is provided hereinbelow with reference to the sequence listing part.

[51008] VGAM3646 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3646 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3646 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51009] VGAM3646 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3646 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3646 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3646 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3646 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51010] The complementary binding of VGAM3646 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3646 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3646 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3646 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51011] It is appreciated that VGAM3646 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3646 host target genes. The mRNA of

each one of this plurality of VGAM3646 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3646 RNA, herein designated VGAM RNA, and which when bound by VGAM3646 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3646 host target proteins.

[51012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3646 gene, herein designated VGAM GENE, on one or more VGAM3646 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[51013] It is yet further appreciated that a function of VGAM3646 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3646 include diagnosis, prevention and treatment of viral infection by *Paramecium bursaria* Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3646 correlate with, and may be deduced from, the identity of the host target genes which VGAM3646 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51014] Nucleotide sequences of the VGAM3646 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3646 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3646 are further described hereinbelow with reference to Table 1.

[51015] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3646 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[51016] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3647 (VGAM3647) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51017] VGAM3647 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3647 was detected is described hereinabove with reference to Figs. 2–8.

[51018] VGAM3647 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3647 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51019] VGAM3647 gene, herein designated VGAM GENE, encodes a VGAM3647 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3647 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3647 precursor RNA is designated SEQ ID:82424, and is provided hereinbelow with reference to the sequence listing part.

[51020] VGAM3647 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51021] An enzyme complex designated DICER COMPLEX, dices the VGAM3647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3647 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3647 RNA is designated SEQ ID:82425,

and is provided hereinbelow with reference to the sequence listing part.

[51022] VGAM3647 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3647 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3647 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51023] VGAM3647 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3647 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3647 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3647 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3647 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51024] The complementary binding of VGAM3647 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3647 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3647 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3647 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51025] It is appreciated that VGAM3647 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3647 host target genes. The mRNA of each one of this plurality of VGAM3647 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3647 RNA, herein designated VGAM RNA, and which when bound by VGAM3647 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3647 host target proteins.

[51026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3647 gene, herein designated VGAM GENE, on one or more VGAM3647 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51027] It is yet further appreciated that a function of VGAM3647 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3647 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3647 correlate with, and may be deduced from, the identity of the host target genes which VGAM3647 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51028] Nucleotide sequences of the VGAM3647 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3647 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3647 are further described hereinbelow with reference to Table 1.

[51029] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3647 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51030] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3648 (VGAM3648) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51031] VGAM3648 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3648 was detected is described hereinabove with reference to Figs. 2–8.

[51032] VGAM3648 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3648 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51033] VGAM3648 gene, herein designated VGAM GENE, encodes a VGAM3648 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3648 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3648 precursor

sor RNA is designated SEQ ID:82434, and is provided hereinbelow with reference to the sequence listing part.

[51034] VGAM3648 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51035] An enzyme complex designated DICER COMPLEX, dices the VGAM3648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3648 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3648 RNA is designated SEQ ID:82435, and is provided hereinbelow with reference to the se-

quence listing part.

[51036] VGAM3648 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3648 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3648 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51037] VGAM3648 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3648 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3648 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3648 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3648 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51038] The complementary binding of VGAM3648 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3648 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3648 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3648 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51039] It is appreciated that VGAM3648 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3648 host target genes. The mRNA of each one of this plurality of VGAM3648 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3648 RNA, herein designated VGAM RNA, and which when bound by VGAM3648 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3648 host target proteins.

[51040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3648 gene, herein designated VGAM GENE, on one or more VGAM3648 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51041] It is yet further appreciated that a function of VGAM3648

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3648 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3648 correlate with, and may be deduced from, the identity of the host target genes which VGAM3648 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51042] Nucleotide sequences of the VGAM3648 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3648 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3648 are further described hereinbelow with reference to Table 1.

[51043] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3648 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51044] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3649 (VGAM3649) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51045] VGAM3649 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3649 was detected is described hereinabove with reference to Figs. 2–8.

[51046] VGAM3649 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3649 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51047] VGAM3649 gene, herein designated VGAM GENE, encodes a VGAM3649 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3649 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3649 precursor RNA is designated SEQ ID:82452, and is provided

hereinbelow with reference to the sequence listing part.

[51048] VGAM3649 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51049] An enzyme complex designated DICER COMPLEX, dices the VGAM3649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3649 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3649 RNA is designated SEQ ID:82453, and is provided hereinbelow with reference to the sequence listing part.

[51050] VGAM3649 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3649 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3649 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51051] VGAM3649 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3649 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3649 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3649 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3649 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51052] The complementary binding of VGAM3649 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3649 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3649 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3649 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51053] It is appreciated that VGAM3649 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3649 host target genes. The mRNA of each one of this plurality of VGAM3649 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3649 RNA, herein designated VGAM RNA, and which when bound by VGAM3649 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3649 host target proteins.

[51054] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3649 gene, herein designated VGAM GENE, on one or more VGAM3649 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51055] It is yet further appreciated that a function of VGAM3649 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3649 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3649 correlate with, and may be deduced from, the identity of the host target genes which VGAM3649 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51056] Nucleotide sequences of the VGAM3649 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3649 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3649 are further described hereinbelow with reference to Table 1.

[51057] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3649 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51058] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3650 (VGAM3650) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51059] VGAM3650 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3650 was detected is described hereinabove with reference to Figs. 2–8.

[51060] VGAM3650 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus C. VGAM3650 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51061] VGAM3650 gene, herein designated VGAM GENE, encodes a VGAM3650 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3650 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3650 precursor RNA is designated SEQ ID:82484, and is provided hereinbelow with reference to the sequence listing part.

[51062] VGAM3650 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51063] An enzyme complex designated DICER COMPLEX, dices the VGAM3650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3650 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3650 RNA is designated SEQ ID:82485, and is provided hereinbelow with reference to the sequence listing part.

[51064] VGAM3650 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3650 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3650 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51065] VGAM3650 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3650 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3650 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3650 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3650 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51066] The complementary binding of VGAM3650 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3650 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3650 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3650 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51067] It is appreciated that VGAM3650 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3650 host target genes. The mRNA of each one of this plurality of VGAM3650 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3650 RNA, herein designated VGAM

RNA, and which when bound by VGAM3650 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3650 host target proteins.

[51068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3650 gene, herein designated VGAM GENE, on one or more VGAM3650 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51069] It is yet further appreciated that a function of VGAM3650 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3650 include diagnosis, prevention and treatment of viral infection by Human adenovirus C. Specific functions, and accordingly utilities, of VGAM3650 correlate with, and may be deduced from, the identity of the host target genes which VGAM3650 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51070] Nucleotide sequences of the VGAM3650 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3650 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3650 are further described hereinbelow with reference to Table 1.

[51071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3650 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51072] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3651 (VGAM3651) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51073] VGAM3651 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3651 was detected is described hereinabove with reference to Figs. 2–8.

[51074] VGAM3651 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus B. VGAM3651 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51075] VGAM3651 gene, herein designated VGAM GENE, encodes a VGAM3651 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3651 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3651 precursor RNA is designated SEQ ID:82489, and is provided hereinbelow with reference to the sequence listing part.

[51076] VGAM3651 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51077] An enzyme complex designated DICER COMPLEX, dices the VGAM3651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3651 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3651 RNA is designated SEQ ID:82490, and is provided hereinbelow with reference to the sequence listing part.

[51078] VGAM3651 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3651 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3651 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51079] VGAM3651 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3651 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3651 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3651 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3651 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51080] The complementary binding of VGAM3651 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3651 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3651 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3651 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51081] It is appreciated that VGAM3651 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3651 host target genes. The mRNA of each one of this plurality of VGAM3651 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3651 RNA, herein designated VGAM RNA, and which when bound by VGAM3651 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3651 host target proteins.

[51082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3651 gene, herein designated VGAM GENE, on one or more VGAM3651 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51083] It is yet further appreciated that a function of VGAM3651 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3651 include diagnosis, prevention and

treatment of viral infection by Human adenovirus B. Specific functions, and accordingly utilities, of VGAM3651 correlate with, and may be deduced from, the identity of the host target genes which VGAM3651 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51084] Nucleotide sequences of the VGAM3651 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3651 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3651 are further described hereinbelow with reference to Table 1.

[51085] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3651 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51086] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3652 (VGAM3652) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51087] VGAM3652 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3652 was detected is described hereinabove with reference to Figs. 2–8.

[51088] VGAM3652 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM3652 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51089] VGAM3652 gene, herein designated VGAM GENE, encodes a VGAM3652 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3652 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3652 precursor RNA is designated SEQ ID:82521, and is provided hereinbelow with reference to the sequence listing part.

[51090] VGAM3652 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3652 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51091] An enzyme complex designated DICER COMPLEX, dices the VGAM3652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3652 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3652 RNA is designated SEQ ID:82522, and is provided hereinbelow with reference to the sequence listing part.

[51092] VGAM3652 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3652 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3652 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51093] VGAM3652 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3652 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3652 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3652 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3652 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51094] The complementary binding of VGAM3652 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3652 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3652 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3652 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51095] It is appreciated that VGAM3652 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3652 host target genes. The mRNA of each one of this plurality of VGAM3652 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3652 RNA, herein designated VGAM RNA, and which when bound by VGAM3652 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3652 host target proteins.

[51096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3652 gene, herein designated VGAM GENE, on one or more VGAM3652 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51097] It is yet further appreciated that a function of VGAM3652 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3652 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM3652 correlate with, and may be deduced from, the identity of the host target genes which VGAM3652 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51098] Nucleotide sequences of the VGAM3652 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3652 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3652 are further described hereinbelow with reference to Table 1.

[51099] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3652 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51100] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3653 (VGAM3653) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[51101] VGAM3653 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3653 was detected is described hereinabove with reference to Figs. 2–8.

[51102] VGAM3653 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM3653 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51103] VGAM3653 gene, herein designated VGAM GENE, encodes a VGAM3653 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3653 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3653 precursor RNA is designated SEQ ID:82536, and is provided hereinbelow with reference to the sequence listing part.

[51104] VGAM3653 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3653 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51105] An enzyme complex designated DICER COMPLEX, dices the VGAM3653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3653 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3653 RNA is designated SEQ ID:82537, and is provided hereinbelow with reference to the sequence listing part.

[51106] VGAM3653 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3653 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3653 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51107] VGAM3653 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3653 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3653 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3653 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3653 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51108] The complementary binding of VGAM3653 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3653 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3653 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3653 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51109] It is appreciated that VGAM3653 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3653 host target genes. The mRNA of each one of this plurality of VGAM3653 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3653 RNA, herein designated VGAM RNA, and which when bound by VGAM3653 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3653 host target proteins.

[51110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3653 gene, herein designated VGAM GENE, on one or more VGAM3653 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51111] It is yet further appreciated that a function of VGAM3653 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3653 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM3653

correlate with, and may be deduced from, the identity of the host target genes which VGAM3653 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51112] Nucleotide sequences of the VGAM3653 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3653 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3653 are further described hereinbelow with reference to Table 1.

[51113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3653 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51114] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3654 (VGAM3654) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[51115] VGAM3654 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3654 was detected is described hereinabove with reference to Figs. 2–8.

[51116] VGAM3654 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3654 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51117] VGAM3654 gene, herein designated VGAM GENE, encodes a VGAM3654 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3654 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3654 precursor RNA is designated SEQ ID:82543, and is provided hereinbelow with reference to the sequence listing part.

[51118] VGAM3654 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51119] An enzyme complex designated DICER COMPLEX, dices the VGAM3654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3654 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3654 RNA is designated SEQ ID:82544, and is provided hereinbelow with reference to the sequence listing part.

[51120] VGAM3654 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3654 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3654 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51121] VGAM3654 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3654 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3654 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3654 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3654 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51122] The complementary binding of VGAM3654 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3654 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3654 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3654 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51123] It is appreciated that VGAM3654 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3654 host target genes. The mRNA of each one of this plurality of VGAM3654 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3654 RNA, herein designated VGAM RNA, and which when bound by VGAM3654 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3654 host target proteins.

[51124] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3654 gene, herein designated VGAM GENE, on one or more VGAM3654 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51125] It is yet further appreciated that a function of VGAM3654 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3654 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3654 correlate with, and may be deduced

from, the identity of the host target genes which VGAM3654 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51126] Nucleotide sequences of the VGAM3654 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3654 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3654 are further described hereinbelow with reference to Table 1.

[51127] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3654 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51128] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3655 (VGAM3655) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51129] VGAM3655 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3655 was detected is described hereinabove with reference to Figs. 2–8.

[51130] VGAM3655 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3655 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51131] VGAM3655 gene, herein designated VGAM GENE, encodes a VGAM3655 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3655 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3655 precursor RNA is designated SEQ ID:82567, and is provided hereinbelow with reference to the sequence listing part.

[51132] VGAM3655 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51133] An enzyme complex designated DICER COMPLEX, dices the VGAM3655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3655 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3655 RNA is designated SEQ ID:82568, and is provided hereinbelow with reference to the sequence listing part.

[51134] VGAM3655 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3655 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3655 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51135] VGAM3655 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3655 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3655 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3655 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3655 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51136] The complementary binding of VGAM3655 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3655 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3655 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3655 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51137] It is appreciated that VGAM3655 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3655 host target genes. The mRNA of each one of this plurality of VGAM3655 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3655 RNA, herein designated VGAM RNA, and which when bound by VGAM3655 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3655 host target proteins.

[51138] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3655 gene, herein designated VGAM GENE, on one or more VGAM3655 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51139] It is yet further appreciated that a function of VGAM3655 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3655 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3655 correlate with, and may be deduced from, the identity of the host target genes which VGAM3655

binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51140] Nucleotide sequences of the VGAM3655 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3655 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3655 are further described hereinbelow with reference to Table 1.

[51141] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3655 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51142] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3656 (VGAM3656) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51143] VGAM3656 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3656 was detected is described hereinabove with reference to Figs. 2–8.

[51144] VGAM3656 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3656 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51145] VGAM3656 gene, herein designated VGAM GENE, encodes a VGAM3656 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3656 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3656 precursor RNA is designated SEQ ID:82574, and is provided hereinbelow with reference to the sequence listing part.

[51146] VGAM3656 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51147] An enzyme complex designated DICER COMPLEX, dices the VGAM3656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3656 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3656 RNA is designated SEQ ID:82575, and is provided hereinbelow with reference to the sequence listing part.

[51148] VGAM3656 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3656 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3656 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51149] VGAM3656 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3656 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3656 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3656 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3656 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[51150] The complementary binding of VGAM3656 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3656 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3656 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3656 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51151] It is appreciated that VGAM3656 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3656 host target genes. The mRNA of each one of this plurality of VGAM3656 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3656 RNA, herein designated VGAM RNA, and which when bound by VGAM3656 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3656 host target proteins.

[51152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3656 gene, herein designated VGAM GENE, on one or more VGAM3656 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51153] It is yet further appreciated that a function of VGAM3656 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3656 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3656 correlate with, and may be deduced from, the identity of the host target genes which VGAM3656 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[51154] Nucleotide sequences of the VGAM3656 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3656 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3656 are further described hereinbelow with reference to Table 1.

[51155] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3656 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51156] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3657 (VGAM3657) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51157] VGAM3657 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3657 was detected is described hereinabove with reference to Figs. 2–8.

[51158] VGAM3657 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM3657 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51159] VGAM3657 gene, herein designated VGAM GENE, encodes a VGAM3657 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3657 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3657 precursor RNA is designated SEQ ID:82586, and is provided hereinbelow with reference to the sequence listing part.

[51160] VGAM3657 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51161] An enzyme complex designated DICER COMPLEX, dices the VGAM3657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3657 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3657 RNA is designated SEQ ID:82587, and is provided hereinbelow with reference to the sequence listing part.

[51162] VGAM3657 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3657 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3657 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[51163] VGAM3657 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3657 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3657 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3657 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3657 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51164] The complementary binding of VGAM3657 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3657 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3657 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3657 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51165] It is appreciated that VGAM3657 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3657 host target genes. The mRNA of each one of this plurality of VGAM3657 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3657 RNA, herein designated VGAM RNA, and which when bound by VGAM3657 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3657 host target proteins.

[51166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3657 gene, herein designated VGAM GENE, on one

or more VGAM3657 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51167] It is yet further appreciated that a function of VGAM3657 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3657 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM3657 correlate with, and may be deduced from, the identity of the host target genes which VGAM3657 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51168] Nucleotide sequences of the VGAM3657 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3657 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3657 are further described hereinbelow with reference to Table 1.

[51169] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3657 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51170] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3658 (VGAM3658) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51171] VGAM3658 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3658 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[51172] VGAM3658 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Simian–Human immunodeficiency virus. VGAM3658 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51173] VGAM3658 gene, herein designated VGAM GENE, encodes a VGAM3658 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3658 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3658 precursor RNA is designated SEQ ID:82591, and is provided hereinbelow with reference to the sequence listing part.

[51174] VGAM3658 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51175] An enzyme complex designated DICER COMPLEX, dices the VGAM3658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3658 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3658 RNA is designated SEQ ID:82592, and is provided hereinbelow with reference to the sequence listing part.

[51176] VGAM3658 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3658 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3658 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51177] VGAM3658 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3658 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3658 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3658 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3658 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51178] The complementary binding of VGAM3658 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3658 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3658 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3658 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51179] It is appreciated that VGAM3658 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3658 host target genes. The mRNA of each one of this plurality of VGAM3658 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3658 RNA, herein designated VGAM RNA, and which when bound by VGAM3658 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3658 host target proteins.

[51180] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3658 gene, herein designated VGAM GENE, on one or more VGAM3658 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51181] It is yet further appreciated that a function of VGAM3658 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3658 include diagnosis, prevention and treatment of viral infection by Simian-Human immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM3658 correlate with, and may be deduced from, the identity of the host target genes which VGAM3658 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51182] Nucleotide sequences of the VGAM3658 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3658 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3658 are further described hereinbelow with reference to Table 1.

[51183] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3658 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51184] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3659 (VGAM3659) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51185] VGAM3659 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3659 was detected is described hereinabove with reference to Figs. 2-8.

[51186] VGAM3659 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3659 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51187] VGAM3659 gene, herein designated VGAM GENE, encodes a VGAM3659 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3659 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3659 precursor RNA is designated SEQ ID:82760, and is provided hereinbelow with reference to the sequence listing part.

[51188] VGAM3659 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[51189] An enzyme complex designated DICER COMPLEX, dices the VGAM3659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3659 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3659 RNA is designated SEQ ID:82761, and is provided hereinbelow with reference to the sequence listing part.

[51190] VGAM3659 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3659 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3659 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51191] VGAM3659 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3659 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3659 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3659 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3659 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51192] The complementary binding of VGAM3659 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3659 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3659 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3659 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51193] It is appreciated that VGAM3659 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3659 host target genes. The mRNA of each one of this plurality of VGAM3659 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3659 RNA, herein designated VGAM RNA, and which when bound by VGAM3659 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3659 host target proteins.

[51194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3659 gene, herein designated VGAM GENE, on one or more VGAM3659 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51195] It is yet further appreciated that a function of VGAM3659 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3659 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3659 correlate with, and may be deduced from, the identity of the host target genes which VGAM3659 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51196] Nucleotide sequences of the VGAM3659 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3659 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3659 are further described hereinbelow with reference to Table 1.

[51197] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3659 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51198] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3660 (VGAM3660) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51199] VGAM3660 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3660 was detected is described hereinabove with reference to Figs. 2-8.

[51200] VGAM3660 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 7. VGAM3660 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51201] VGAM3660 gene, herein designated VGAM GENE, encodes a VGAM3660 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3660 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3660 precursor RNA is designated SEQ ID:82765, and is provided hereinbelow with reference to the sequence listing part.

[51202] VGAM3660 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51203] An enzyme complex designated DICER COMPLEX, dices the VGAM3660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3660 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3660 RNA is designated SEQ ID:82766, and is provided hereinbelow with reference to the sequence listing part.

[51204] VGAM3660 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3660 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3660 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51205] VGAM3660 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3660 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3660 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3660 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3660 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51206] The complementary binding of VGAM3660 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3660 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3660 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3660 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51207] It is appreciated that VGAM3660 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3660 host target genes. The mRNA of each one of this plurality of VGAM3660 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3660 RNA, herein designated VGAM RNA, and which when bound by VGAM3660 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3660 host target proteins.

[51208] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3660 gene, herein designated VGAM GENE, on one or more VGAM3660 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51209] It is yet further appreciated that a function of VGAM3660 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3660 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3660 correlate with, and may be deduced from, the identity of the host target genes which VGAM3660 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51210] Nucleotide sequences of the VGAM3660 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3660 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3660 are further described hereinbelow with reference to Table 1.

[51211] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3660 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51212] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3661 (VGAM3661) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51213] VGAM3661 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3661 was detected is described hereinabove with reference to Figs. 2-8.

[51214] VGAM3661 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7.

VGAM3661 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51215] VGAM3661 gene, herein designated VGAM GENE, encodes a VGAM3661 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3661 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3661 precursor RNA is designated SEQ ID:82770, and is provided hereinbelow with reference to the sequence listing part.

[51216] VGAM3661 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51217] An enzyme complex designated DICER COMPLEX, dices

the VGAM3661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3661 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3661 RNA is designated SEQ ID:82771, and is provided hereinbelow with reference to the sequence listing part.

[51218] VGAM3661 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3661 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3661 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51219] VGAM3661 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3661 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3661 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3661 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3661 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51220] The complementary binding of VGAM3661 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3661 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3661 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3661 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51221] It is appreciated that VGAM3661 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3661 host target genes. The mRNA of each one of this plurality of VGAM3661 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3661 RNA, herein designated VGAM RNA, and which when bound by VGAM3661 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3661 host target proteins.

[51222] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3661 gene, herein designated VGAM GENE, on one or more VGAM3661 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51223] It is yet further appreciated that a function of VGAM3661 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3661 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3661 correlate with, and may be deduced from, the identity of the host target genes which VGAM3661 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51224] Nucleotide sequences of the VGAM3661 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3661 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3661 are further described hereinbelow with reference to Table 1.

[51225] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3661 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51226] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3662 (VGAM3662) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51227] VGAM3662 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3662 was detected is described hereinabove with reference to Figs. 2-8.

[51228] VGAM3662 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM3662 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[51229] VGAM3662 gene, herein designated VGAM GENE, encodes a VGAM3662 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3662 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3662 precursor RNA is designated SEQ ID:82773, and is provided hereinbelow with reference to the sequence listing part.

[51230] VGAM3662 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51231] An enzyme complex designated DICER COMPLEX, dices the VGAM3662 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3662 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3662 RNA is designated SEQ ID:82774, and is provided hereinbelow with reference to the sequence listing part.

[51232] VGAM3662 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3662 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3662 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51233] VGAM3662 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3662 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3662 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3662 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3662 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51234] The complementary binding of VGAM3662 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3662 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3662

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3662 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51235] It is appreciated that VGAM3662 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3662 host target genes. The mRNA of each one of this plurality of VGAM3662 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3662 RNA, herein designated VGAM RNA, and which when bound by VGAM3662 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3662 host target proteins.

[51236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3662 gene, herein designated VGAM GENE, on one or more VGAM3662 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51237] It is yet further appreciated that a function of VGAM3662 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3662 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM3662 correlate with, and may be deduced from, the identity of the host target genes which VGAM3662 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51238] Nucleotide sequences of the VGAM3662 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3662 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3662 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3662 are further described hereinbelow with reference to Table 1.

[51239] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3662 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51240] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3663 (VGAM3663) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51241] VGAM3663 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3663 was detected is described hereinabove with reference to Figs. 2-8.

[51242] VGAM3663 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice grassy stunt virus. VGAM3663 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[51243] VGAM3663 gene, herein designated VGAM GENE, encodes a VGAM3663 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3663 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3663 precursor RNA is designated SEQ ID:82806, and is provided hereinbelow with reference to the sequence listing part.

[51244] VGAM3663 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51245] An enzyme complex designated DICER COMPLEX, dices the VGAM3663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3663 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3663 RNA is designated SEQ ID:82807, and is provided hereinbelow with reference to the sequence listing part.

[51246] VGAM3663 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3663 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3663 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51247] VGAM3663 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3663 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3663 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3663 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3663 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51248] The complementary binding of VGAM3663 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3663 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3663 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3663 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51249] It is appreciated that VGAM3663 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3663 host target genes. The mRNA of each one of this plurality of VGAM3663 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3663 RNA, herein designated VGAM RNA, and which when bound by VGAM3663 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3663 host target proteins.

[51250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3663 gene, herein designated VGAM GENE, on one or more VGAM3663 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51251] It is yet further appreciated that a function of VGAM3663 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3663 include diagnosis, prevention and treatment of viral infection by Rice grassy stunt virus. Specific functions, and accordingly utilities, of VGAM3663 correlate with, and may be deduced from, the identity of the host target genes which VGAM3663 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51252] Nucleotide sequences of the VGAM3663 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3663 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3663 are further

described hereinbelow with reference to Table 1.

[51253] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3663 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51254] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3664 (VGAM3664) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51255] VGAM3664 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3664 was detected is described hereinabove with reference to Figs. 2-8.

[51256] VGAM3664 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mild yellow edge virus. VGAM3664 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51257] VGAM3664 gene, herein designated VGAM GENE, encodes a VGAM3664 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3664 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3664 precursor RNA is designated SEQ ID:82821, and is provided hereinbelow with reference to the sequence listing part.

[51258] VGAM3664 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51259] An enzyme complex designated DICER COMPLEX, dices the VGAM3664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3664 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3664 RNA is designated SEQ ID:82822, and is provided hereinbelow with reference to the sequence listing part.

[51260] VGAM3664 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3664 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3664 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51261] VGAM3664 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3664 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3664 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3664 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3664 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51262] The complementary binding of VGAM3664 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3664 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3664 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3664 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51263] It is appreciated that VGAM3664 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3664 host target genes. The mRNA of each one of this plurality of VGAM3664 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3664 RNA, herein designated VGAM RNA, and which when bound by VGAM3664 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3664 host target proteins.

[51264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3664 gene, herein designated VGAM GENE, on one or more VGAM3664 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51265] It is yet further appreciated that a function of VGAM3664 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3664 include diagnosis, prevention and treatment of viral infection by Strawberry mild yellow edge virus. Specific functions, and accordingly utilities, of VGAM3664 correlate with, and may be deduced from, the identity of the host target genes which VGAM3664 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51266] Nucleotide sequences of the VGAM3664 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3664 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3664 are further described hereinbelow with reference to Table 1.

[51267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3664 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51268] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3665 (VGAM3665) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51269] VGAM3665 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3665 was detected is described hereinabove with reference to Figs. 2-8.

[51270] VGAM3665 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM3665 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51271] VGAM3665 gene, herein designated VGAM GENE, encodes

a VGAM3665 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3665 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3665 precursor RNA is designated SEQ ID:82826, and is provided hereinbelow with reference to the sequence listing part.

[51272] VGAM3665 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51273] An enzyme complex designated DICER COMPLEX, dices the VGAM3665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3665 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3665 RNA is designated SEQ ID:82827, and is provided hereinbelow with reference to the sequence listing part.

[51274] VGAM3665 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3665 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3665 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51275] VGAM3665 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3665 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3665 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3665 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3665 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51276] The complementary binding of VGAM3665 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3665 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3665 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3665 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[51277] It is appreciated that VGAM3665 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3665 host target genes. The mRNA of each one of this plurality of VGAM3665 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3665 RNA, herein designated VGAM RNA, and which when bound by VGAM3665 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3665 host target proteins.

[51278] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3665 gene, herein designated VGAM GENE, on one or more VGAM3665 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51279] It is yet further appreciated that a function of VGAM3665 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3665 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3665 correlate with, and may be deduced from, the identity of the host target genes which VGAM3665 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51280] Nucleotide sequences of the VGAM3665 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3665 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3665 are further described hereinbelow with reference to Table 1.

[51281] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3665 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51282] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3666 (VGAM3666) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51283] VGAM3666 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3666 was detected is described hereinabove with reference to Figs. 2-8.

[51284] VGAM3666 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3666 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51285] VGAM3666 gene, herein designated VGAM GENE, encodes a VGAM3666 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3666 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3666 precursor RNA is designated SEQ ID:82839, and is provided hereinbelow with reference to the sequence listing part.

[51286] VGAM3666 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51287] An enzyme complex designated DICER COMPLEX, dices the VGAM3666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3666 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3666 RNA is designated SEQ ID:82840, and is provided hereinbelow with reference to the sequence listing part.

[51288] VGAM3666 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3666 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3666 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51289] VGAM3666 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3666 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3666 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3666 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3666 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51290] The complementary binding of VGAM3666 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3666 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3666 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3666 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51291] It is appreciated that VGAM3666 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3666 host target genes. The mRNA of each one of this plurality of VGAM3666 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3666 RNA, herein designated VGAM RNA, and which when bound by VGAM3666 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3666 host target proteins.

[51292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3666 gene, herein designated VGAM GENE, on one or more VGAM3666 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51293] It is yet further appreciated that a function of VGAM3666 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3666 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3666 correlate with, and may be deduced from, the identity of the host target genes which VGAM3666 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51294] Nucleotide sequences of the VGAM3666 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3666 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3666 are further described hereinbelow with reference to Table 1.

[51295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3666 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51296] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3667 (VGAM3667) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51297] VGAM3667 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3667 was detected is described hereinabove with reference to Figs. 2-8.

[51298] VGAM3667 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3667 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51299] VGAM3667 gene, herein designated VGAM GENE, encodes a VGAM3667 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3667 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3667 precursor RNA is designated SEQ ID:82884, and is provided hereinbelow with reference to the sequence listing part.

[51300] VGAM3667 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51301] An enzyme complex designated DICER COMPLEX, dices the VGAM3667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3667 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3667 RNA is designated SEQ ID:82885, and is provided hereinbelow with reference to the sequence listing part.

[51302] VGAM3667 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3667 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3667 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51303] VGAM3667 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3667 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3667 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3667 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3667 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51304] The complementary binding of VGAM3667 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3667 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3667 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3667 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51305] It is appreciated that VGAM3667 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3667 host target genes. The mRNA of each one of this plurality of VGAM3667 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3667 RNA, herein designated VGAM RNA, and which when bound by VGAM3667 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3667 host target proteins.

[51306] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3667 gene, herein designated VGAM GENE, on one or more VGAM3667 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51307] It is yet further appreciated that a function of VGAM3667 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3667 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3667 correlate with, and may be deduced from, the identity of the host target genes which VGAM3667 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51308] Nucleotide sequences of the VGAM3667 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3667 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3667 are further described hereinbelow with reference to Table 1.

[51309] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3667 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51310] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3668 (VGAM3668) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51311] VGAM3668 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3668 was detected is described hereinabove with reference to Figs. 2–8.

[51312] VGAM3668 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine rhinovirus 3. VGAM3668 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51313] VGAM3668 gene, herein designated VGAM GENE, encodes a VGAM3668 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3668 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3668 precursor RNA is designated SEQ ID:82896, and is provided hereinbelow with reference to the sequence listing part.

[51314] VGAM3668 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51315] An enzyme complex designated DICER COMPLEX, dices the VGAM3668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3668 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3668 RNA is designated SEQ ID:82897, and is provided hereinbelow with reference to the sequence listing part.

[51316] VGAM3668 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3668 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3668 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51317] VGAM3668 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3668 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3668 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3668 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3668 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51318] The complementary binding of VGAM3668 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3668 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3668 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3668 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51319] It is appreciated that VGAM3668 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3668 host target genes. The mRNA of each one of this plurality of VGAM3668 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3668 RNA, herein designated VGAM RNA, and which when bound by VGAM3668 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3668 host target proteins.

[51320] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3668 gene, herein designated VGAM GENE, on one or more VGAM3668 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [51321] It is yet further appreciated that a function of VGAM3668 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3668 include diagnosis, prevention and treatment of viral infection by Equine rhinovirus 3. Specific functions, and accordingly utilities, of VGAM3668 correlate with, and may be deduced from, the identity of the host target genes which VGAM3668 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [51322] Nucleotide sequences of the VGAM3668 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3668 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3668 are further described hereinbelow with reference to Table 1.
- [51323] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3668 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51324] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3669 (VGAM3669) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51325] VGAM3669 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3669 was detected is described hereinabove with reference to Figs. 2–8.

[51326] VGAM3669 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM3669 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51327] VGAM3669 gene, herein designated VGAM GENE, encodes a VGAM3669 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3669 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3669 precursor RNA is designated SEQ ID:83006, and is provided hereinbelow with reference to the sequence listing part.

[51328] VGAM3669 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51329] An enzyme complex designated DICER COMPLEX, dices the VGAM3669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3669 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3669 RNA is designated SEQ ID:83007, and is provided hereinbelow with reference to the sequence listing part.

[51330] VGAM3669 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3669 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3669 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51331] VGAM3669 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3669 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3669 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3669 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3669 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51332] The complementary binding of VGAM3669 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3669 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3669 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3669 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51333] It is appreciated that VGAM3669 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3669 host target genes. The mRNA of

each one of this plurality of VGAM3669 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3669 RNA, herein designated VGAM RNA, and which when bound by VGAM3669 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3669 host target proteins.

[51334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3669 gene, herein designated VGAM GENE, on one or more VGAM3669 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[51335] It is yet further appreciated that a function of VGAM3669 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3669 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3669 correlate with, and may be deduced from, the identity of the host target genes which VGAM3669 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51336] Nucleotide sequences of the VGAM3669 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3669 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3669 are further described hereinbelow with reference to Table 1.

[51337] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3669 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[51338] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3670 (VGAM3670) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51339] VGAM3670 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3670 was detected is described hereinabove with reference to Figs. 2–8.

[51340] VGAM3670 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM3670 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51341] VGAM3670 gene, herein designated VGAM GENE, encodes a VGAM3670 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3670 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3670 precursor RNA is designated SEQ ID:83026, and is provided hereinbelow with reference to the sequence listing part.

[51342] VGAM3670 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51343] An enzyme complex designated DICER COMPLEX, dices the VGAM3670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3670 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3670 RNA is designated SEQ ID:83027,

and is provided hereinbelow with reference to the sequence listing part.

[51344] VGAM3670 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3670 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3670 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51345] VGAM3670 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3670 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3670 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3670 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3670 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51346] The complementary binding of VGAM3670 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3670 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3670 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3670 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51347] It is appreciated that VGAM3670 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3670 host target genes. The mRNA of each one of this plurality of VGAM3670 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3670 RNA, herein designated VGAM RNA, and which when bound by VGAM3670 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3670 host target proteins.

[51348] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3670 gene, herein designated VGAM GENE, on one or more VGAM3670 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51349] It is yet further appreciated that a function of VGAM3670 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3670 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3670 correlate with, and may be deduced from, the identity of the host target genes which VGAM3670 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51350] Nucleotide sequences of the VGAM3670 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3670 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3670 are further described hereinbelow with reference to Table 1.

[51351] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3670 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51352] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3671 (VGAM3671) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51353] VGAM3671 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3671 was detected is described hereinabove with reference to Figs. 2–8.

[51354] VGAM3671 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM3671 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51355] VGAM3671 gene, herein designated VGAM GENE, encodes a VGAM3671 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3671 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3671 precu-

sor RNA is designated SEQ ID:83053, and is provided hereinbelow with reference to the sequence listing part.

[51356] VGAM3671 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51357] An enzyme complex designated DICER COMPLEX, dices the VGAM3671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3671 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3671 RNA is designated SEQ ID:83054, and is provided hereinbelow with reference to the se-

quence listing part.

[51358] VGAM3671 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3671 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3671 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51359] VGAM3671 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3671 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3671 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3671 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3671 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51360] The complementary binding of VGAM3671 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3671 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3671 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3671 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51361] It is appreciated that VGAM3671 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3671 host target genes. The mRNA of each one of this plurality of VGAM3671 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3671 RNA, herein designated VGAM RNA, and which when bound by VGAM3671 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3671 host target proteins.

[51362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3671 gene, herein designated VGAM GENE, on one or more VGAM3671 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51363] It is yet further appreciated that a function of VGAM3671

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3671 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM3671 correlate with, and may be deduced from, the identity of the host target genes which VGAM3671 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51364] Nucleotide sequences of the VGAM3671 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3671 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3671 are further described hereinbelow with reference to Table 1.

[51365] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3671 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51366] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3672 (VGAM3672) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51367] VGAM3672 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3672 was detected is described hereinabove with reference to Figs. 2–8.

[51368] VGAM3672 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3672 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51369] VGAM3672 gene, herein designated VGAM GENE, encodes a VGAM3672 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3672 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3672 precursor RNA is designated SEQ ID:83062, and is provided

hereinbelow with reference to the sequence listing part.

[51370] VGAM3672 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51371] An enzyme complex designated DICER COMPLEX, dices the VGAM3672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3672 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3672 RNA is designated SEQ ID:83063, and is provided hereinbelow with reference to the sequence listing part.

[51372] VGAM3672 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3672 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3672 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51373] VGAM3672 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3672 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3672 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3672 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3672 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51374] The complementary binding of VGAM3672 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3672 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3672 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3672 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51375] It is appreciated that VGAM3672 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3672 host target genes. The mRNA of each one of this plurality of VGAM3672 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3672 RNA, herein designated VGAM RNA, and which when bound by VGAM3672 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3672 host target proteins.

[51376] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3672 gene, herein designated VGAM GENE, on one or more VGAM3672 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51377] It is yet further appreciated that a function of VGAM3672 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3672 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3672 correlate with, and may be deduced from, the identity of the host target genes which VGAM3672 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51378] Nucleotide sequences of the VGAM3672 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3672 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3672 are further described hereinbelow with reference to Table 1.

[51379] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3672 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51380] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3673 (VGAM3673) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51381] VGAM3673 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3673 was detected is described hereinabove with reference to Figs. 2–8.

[51382] VGAM3673 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3673 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51383] VGAM3673 gene, herein designated VGAM GENE, encodes a VGAM3673 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3673 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3673 precursor RNA is designated SEQ ID:83090, and is provided hereinbelow with reference to the sequence listing part.

[51384] VGAM3673 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51385] An enzyme complex designated DICER COMPLEX, dices the VGAM3673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3673 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3673 RNA is designated SEQ ID:83091, and is provided hereinbelow with reference to the sequence listing part.

[51386] VGAM3673 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3673 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3673 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51387] VGAM3673 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3673 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3673 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3673 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3673 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51388] The complementary binding of VGAM3673 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3673 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3673 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3673 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51389] It is appreciated that VGAM3673 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3673 host target genes. The mRNA of each one of this plurality of VGAM3673 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3673 RNA, herein designated VGAM

RNA, and which when bound by VGAM3673 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3673 host target proteins.

[51390] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3673 gene, herein designated VGAM GENE, on one or more VGAM3673 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51391] It is yet further appreciated that a function of VGAM3673 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3673 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3673 correlate with, and may be deduced from, the identity of the host target genes which VGAM3673 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51392] Nucleotide sequences of the VGAM3673 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3673 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3673 are further described hereinbelow with reference to Table 1.

[51393] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3673 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51394] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3674 (VGAM3674) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51395] VGAM3674 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3674 was detected is described hereinabove with reference to Figs. 2-8.

[51396] VGAM3674 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM3674 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51397] VGAM3674 gene, herein designated VGAM GENE, encodes a VGAM3674 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3674 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3674 precursor RNA is designated SEQ ID:83095, and is provided hereinbelow with reference to the sequence listing part.

[51398] VGAM3674 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51399] An enzyme complex designated DICER COMPLEX, dices the VGAM3674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3674 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3674 RNA is designated SEQ ID:83096, and is provided hereinbelow with reference to the sequence listing part.

[51400] VGAM3674 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3674 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3674 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51401] VGAM3674 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3674 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3674 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3674 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3674 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51402] The complementary binding of VGAM3674 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3674 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3674 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3674 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51403] It is appreciated that VGAM3674 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3674 host target genes. The mRNA of each one of this plurality of VGAM3674 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3674 RNA, herein designated VGAM RNA, and which when bound by VGAM3674 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3674 host target proteins.

[51404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3674 gene, herein designated VGAM GENE, on one or more VGAM3674 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51405] It is yet further appreciated that a function of VGAM3674 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3674 include diagnosis, prevention and

treatment of viral infection by *Macaca mulatta* rhadinovirus. Specific functions, and accordingly utilities, of VGAM3674 correlate with, and may be deduced from, the identity of the host target genes which VGAM3674 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51406] Nucleotide sequences of the VGAM3674 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3674 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3674 are further described hereinbelow with reference to Table 1.

[51407] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3674 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51408] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3675 (VGAM3675) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51409] VGAM3675 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3675 was detected is described hereinabove with reference to Figs. 2–8.

[51410] VGAM3675 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea seed-borne mosaic virus. VGAM3675 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51411] VGAM3675 gene, herein designated VGAM GENE, encodes a VGAM3675 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3675 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3675 precursor RNA is designated SEQ ID:83215, and is provided hereinbelow with reference to the sequence listing part.

[51412] VGAM3675 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3675 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51413] An enzyme complex designated DICER COMPLEX, dices the VGAM3675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3675 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3675 RNA is designated SEQ ID:83216, and is provided hereinbelow with reference to the sequence listing part.

[51414] VGAM3675 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3675 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3675 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51415] VGAM3675 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3675 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3675 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3675 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3675 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51416] The complementary binding of VGAM3675 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3675 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3675 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3675 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51417] It is appreciated that VGAM3675 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3675 host target genes. The mRNA of each one of this plurality of VGAM3675 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3675 RNA, herein designated VGAM RNA, and which when bound by VGAM3675 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3675 host target proteins.

[51418] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3675 gene, herein designated VGAM GENE, on one or more VGAM3675 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51419] It is yet further appreciated that a function of VGAM3675 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3675 include diagnosis, prevention and treatment of viral infection by Pea seed-borne mosaic

virus. Specific functions, and accordingly utilities, of VGAM3675 correlate with, and may be deduced from, the identity of the host target genes which VGAM3675 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51420] Nucleotide sequences of the VGAM3675 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3675 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3675 are further described hereinbelow with reference to Table 1.

[51421] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3675 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51422] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3676 (VGAM3676) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[51423] VGAM3676 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3676 was detected is described hereinabove with reference to Figs. 2–8.

[51424] VGAM3676 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Satellite virus of maize white line mosaic virus. VGAM3676 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51425] VGAM3676 gene, herein designated VGAM GENE, encodes a VGAM3676 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3676 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3676 precursor RNA is designated SEQ ID:83224, and is provided hereinbelow with reference to the sequence listing part.

[51426] VGAM3676 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3676 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51427] An enzyme complex designated DICER COMPLEX, dices the VGAM3676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3676 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3676 RNA is designated SEQ ID:83225, and is provided hereinbelow with reference to the sequence listing part.

[51428] VGAM3676 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3676 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3676 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51429] VGAM3676 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3676 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3676 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3676 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3676 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51430] The complementary binding of VGAM3676 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3676 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3676 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3676 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51431] It is appreciated that VGAM3676 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3676 host target genes. The mRNA of each one of this plurality of VGAM3676 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3676 RNA, herein designated VGAM RNA, and which when bound by VGAM3676 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3676 host target proteins.

[51432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3676 gene, herein designated VGAM GENE, on one or more VGAM3676 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51433] It is yet further appreciated that a function of VGAM3676 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3676 include diagnosis, prevention and treatment of viral infection by Satellite virus of maize white line mosaic virus. Specific functions, and accord-

ingly utilities, of VGAM3676 correlate with, and may be deduced from, the identity of the host target genes which VGAM3676 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51434] Nucleotide sequences of the VGAM3676 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3676 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3676 are further described hereinbelow with reference to Table 1.

[51435] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3676 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51436] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3677 (VGAM3677) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[51437] VGAM3677 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3677 was detected is described hereinabove with reference to Figs. 2–8.

[51438] VGAM3677 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM3677 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51439] VGAM3677 gene, herein designated VGAM GENE, encodes a VGAM3677 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3677 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3677 precursor RNA is designated SEQ ID:83231, and is provided hereinbelow with reference to the sequence listing part.

[51440] VGAM3677 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51441] An enzyme complex designated DICER COMPLEX, dices the VGAM3677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3677 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3677 RNA is designated SEQ ID:83232, and is provided hereinbelow with reference to the sequence listing part.

[51442] VGAM3677 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3677 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3677 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51443] VGAM3677 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3677 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3677 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3677 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3677 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51444] The complementary binding of VGAM3677 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3677 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3677 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3677 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51445] It is appreciated that VGAM3677 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3677 host target genes. The mRNA of each one of this plurality of VGAM3677 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3677 RNA, herein designated VGAM RNA, and which when bound by VGAM3677 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3677 host target proteins.

[51446] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3677 gene, herein designated VGAM GENE, on one or more VGAM3677 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51447] It is yet further appreciated that a function of VGAM3677 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3677 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3677 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3677 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51448] Nucleotide sequences of the VGAM3677 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3677 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3677 are further described hereinbelow with reference to Table 1.

[51449] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3677 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51450] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3678 (VGAM3678) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51451] VGAM3678 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3678 was detected is described hereinabove with reference to Figs. 2–8.

[51452] VGAM3678 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3678 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51453] VGAM3678 gene, herein designated VGAM GENE, encodes a VGAM3678 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3678 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3678 precursor RNA is designated SEQ ID:83253, and is provided hereinbelow with reference to the sequence listing part.

[51454] VGAM3678 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51455] An enzyme complex designated DICER COMPLEX, dices the VGAM3678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3678 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3678 RNA is designated SEQ ID:83254, and is provided hereinbelow with reference to the sequence listing part.

[51456] VGAM3678 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3678 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3678 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51457] VGAM3678 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3678 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3678 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3678 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3678 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51458] The complementary binding of VGAM3678 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3678 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3678 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3678 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51459] It is appreciated that VGAM3678 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3678 host target genes. The mRNA of each one of this plurality of VGAM3678 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3678 RNA, herein designated VGAM RNA, and which when bound by VGAM3678 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3678 host target proteins.

[51460] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3678 gene, herein designated VGAM GENE, on one or more VGAM3678 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51461] It is yet further appreciated that a function of VGAM3678 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3678 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3678 correlate with, and may be deduced from, the identity of the host target genes which VGAM3678 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[51462] Nucleotide sequences of the VGAM3678 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3678 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3678 are further described hereinbelow with reference to Table 1.

[51463] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3678 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51464] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3679 (VGAM3679) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51465] VGAM3679 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3679 was detected is described hereinabove with reference to Figs. 2–8.

[51466] VGAM3679 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3679 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51467] VGAM3679 gene, herein designated VGAM GENE, encodes a VGAM3679 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3679 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3679 precursor RNA is designated SEQ ID:83259, and is provided hereinbelow with reference to the sequence listing part.

[51468] VGAM3679 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51469] An enzyme complex designated DICER COMPLEX, dices the VGAM3679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3679 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3679 RNA is designated SEQ ID:83260, and is provided hereinbelow with reference to the sequence listing part.

[51470] VGAM3679 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3679 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3679 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51471] VGAM3679 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3679 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3679 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3679 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3679 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[51472] The complementary binding of VGAM3679 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3679 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3679 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3679 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51473] It is appreciated that VGAM3679 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3679 host target genes. The mRNA of each one of this plurality of VGAM3679 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3679 RNA, herein designated VGAM RNA, and which when bound by VGAM3679 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3679 host target proteins.

[51474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3679 gene, herein designated VGAM GENE, on one or more VGAM3679 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51475] It is yet further appreciated that a function of VGAM3679 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3679 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3679 correlate with, and may be deduced from, the identity of the host target genes which VGAM3679 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[51476] Nucleotide sequences of the VGAM3679 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3679 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3679 are further described hereinbelow with reference to Table 1.

[51477] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3679 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51478] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3680 (VGAM3680) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51479] VGAM3680 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3680 was detected is described hereinabove with reference to Figs. 2–8.

[51480] VGAM3680 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3680 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51481] VGAM3680 gene, herein designated VGAM GENE, encodes a VGAM3680 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3680 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3680 precursor RNA is designated SEQ ID:83263, and is provided hereinbelow with reference to the sequence listing part.

[51482] VGAM3680 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51483] An enzyme complex designated DICER COMPLEX, dices the VGAM3680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3680 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3680 RNA is designated SEQ ID:83264, and is provided hereinbelow with reference to the sequence listing part.

[51484] VGAM3680 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3680 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3680 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[51485] VGAM3680 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3680 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3680 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3680 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3680 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51486] The complementary binding of VGAM3680 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3680 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3680 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3680 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51487] It is appreciated that VGAM3680 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3680 host target genes. The mRNA of each one of this plurality of VGAM3680 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3680 RNA, herein designated VGAM RNA, and which when bound by VGAM3680 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3680 host target proteins.

[51488] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3680 gene, herein designated VGAM GENE, on one

or more VGAM3680 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51489] It is yet further appreciated that a function of VGAM3680 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3680 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3680 correlate with, and may be deduced from, the identity of the host target genes which VGAM3680 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51490] Nucleotide sequences of the VGAM3680 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3680 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3680 are further described hereinbelow with reference to Table 1.

[51491] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3680 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51492] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3681 (VGAM3681) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51493] VGAM3681 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3681 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[51494] VGAM3681 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM3681 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51495] VGAM3681 gene, herein designated VGAM GENE, encodes a VGAM3681 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3681 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3681 precursor RNA is designated SEQ ID:83271, and is provided hereinbelow with reference to the sequence listing part.

[51496] VGAM3681 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51497] An enzyme complex designated DICER COMPLEX, dices the VGAM3681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3681 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3681 RNA is designated SEQ ID:83272, and is provided hereinbelow with reference to the sequence listing part.

[51498] VGAM3681 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3681 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3681 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51499] VGAM3681 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3681 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3681 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3681 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3681 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51500] The complementary binding of VGAM3681 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3681 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3681 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3681 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51501] It is appreciated that VGAM3681 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3681 host target genes. The mRNA of each one of this plurality of VGAM3681 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3681 RNA, herein designated VGAM RNA, and which when bound by VGAM3681 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3681 host target proteins.

[51502] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3681 gene, herein designated VGAM GENE, on one or more VGAM3681 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51503] It is yet further appreciated that a function of VGAM3681 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3681 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM3681 correlate with, and may be deduced from, the identity of the host target genes which VGAM3681 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51504] Nucleotide sequences of the VGAM3681 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3681 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3681 are further described hereinbelow with reference to Table 1.

[51505] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3681 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51506] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3682 (VGAM3682) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51507] VGAM3682 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3682 was detected is described hereinabove with reference to Figs. 2-8.

[51508] VGAM3682 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM3682 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51509] VGAM3682 gene, herein designated VGAM GENE, encodes a VGAM3682 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3682 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3682 precursor RNA is designated SEQ ID:83296, and is provided hereinbelow with reference to the sequence listing part.

[51510] VGAM3682 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[51511] An enzyme complex designated DICER COMPLEX, dices the VGAM3682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3682 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3682 RNA is designated SEQ ID:83297, and is provided hereinbelow with reference to the sequence listing part.

[51512] VGAM3682 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3682 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3682 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51513] VGAM3682 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3682 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3682 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3682 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3682 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51514] The complementary binding of VGAM3682 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3682 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3682 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3682 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51515] It is appreciated that VGAM3682 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3682 host target genes. The mRNA of each one of this plurality of VGAM3682 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3682 RNA, herein designated VGAM RNA, and which when bound by VGAM3682 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3682 host target proteins.

[51516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3682 gene, herein designated VGAM GENE, on one or more VGAM3682 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51517] It is yet further appreciated that a function of VGAM3682 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3682 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM3682 correlate with, and may be deduced from, the identity of the host target genes which VGAM3682 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51518] Nucleotide sequences of the VGAM3682 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3682 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3682 are further described hereinbelow with reference to Table 1.

[51519] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3682 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51520] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3683 (VGAM3683) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51521] VGAM3683 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3683 was detected is described hereinabove with reference to Figs. 2-8.

[51522] VGAM3683 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Planococcus citri denso-virus. VGAM3683 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51523] VGAM3683 gene, herein designated VGAM GENE, encodes a VGAM3683 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3683 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3683 precursor RNA is designated SEQ ID:83333, and is provided hereinbelow with reference to the sequence listing part.

[51524] VGAM3683 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51525] An enzyme complex designated DICER COMPLEX, dices the VGAM3683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3683 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3683 RNA is designated SEQ ID:83334, and is provided hereinbelow with reference to the sequence listing part.

[51526] VGAM3683 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3683 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3683 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51527] VGAM3683 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3683 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3683 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3683 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3683 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51528] The complementary binding of VGAM3683 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3683 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3683 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3683 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51529] It is appreciated that VGAM3683 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3683 host target genes. The mRNA of each one of this plurality of VGAM3683 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3683 RNA, herein designated VGAM RNA, and which when bound by VGAM3683 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3683 host target proteins.

[51530] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3683 gene, herein designated VGAM GENE, on one or more VGAM3683 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51531] It is yet further appreciated that a function of VGAM3683 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3683 include diagnosis, prevention and treatment of viral infection by Planococcus citri densovirus. Specific functions, and accordingly utilities, of VGAM3683 correlate with, and may be deduced from, the identity of the host target genes which VGAM3683 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51532] Nucleotide sequences of the VGAM3683 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3683 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3683 are further described hereinbelow with reference to Table 1.

[51533] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3683 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51534] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3684 (VGAM3684) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51535] VGAM3684 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3684 was detected is described hereinabove with reference to Figs. 2-8.

[51536] VGAM3684 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Trichomonas vaginalis*

virus 3. VGAM3684 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51537] VGAM3684 gene, herein designated VGAM GENE, encodes a VGAM3684 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3684 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3684 precursor RNA is designated SEQ ID:83343, and is provided hereinbelow with reference to the sequence listing part.

[51538] VGAM3684 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51539] An enzyme complex designated DICER COMPLEX, dices

the VGAM3684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3684 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3684 RNA is designated SEQ ID:83344, and is provided hereinbelow with reference to the sequence listing part.

[51540] VGAM3684 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3684 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3684 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51541] VGAM3684 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3684 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3684 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3684 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3684 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51542] The complementary binding of VGAM3684 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3684 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3684 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3684 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51543] It is appreciated that VGAM3684 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3684 host target genes. The mRNA of each one of this plurality of VGAM3684 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3684 RNA, herein designated VGAM RNA, and which when bound by VGAM3684 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3684 host target proteins.

[51544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3684 gene, herein designated VGAM GENE, on one or more VGAM3684 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51545] It is yet further appreciated that a function of VGAM3684 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3684 include diagnosis, prevention and treatment of viral infection by Trichomonas vaginalis virus 3. Specific functions, and accordingly utilities, of VGAM3684 correlate with, and may be deduced from, the identity of the host target genes which VGAM3684 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51546] Nucleotide sequences of the VGAM3684 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3684 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3684 are further described hereinbelow with reference to Table 1.

[51547] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3684 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51548] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3685 (VGAM3685) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51549] VGAM3685 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3685 was detected is described hereinabove with reference to Figs. 2-8.

[51550] VGAM3685 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM3685 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[51551] VGAM3685 gene, herein designated VGAM GENE, encodes a VGAM3685 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3685 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3685 precursor RNA is designated SEQ ID:83355, and is provided hereinbelow with reference to the sequence listing part.

[51552] VGAM3685 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51553] An enzyme complex designated DICER COMPLEX, dices the VGAM3685 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3685 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3685 RNA is designated SEQ ID:83356, and is provided hereinbelow with reference to the sequence listing part.

[51554] VGAM3685 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3685 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3685 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51555] VGAM3685 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3685 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3685 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3685 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3685 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51556] The complementary binding of VGAM3685 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3685 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3685

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3685 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51557] It is appreciated that VGAM3685 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3685 host target genes. The mRNA of each one of this plurality of VGAM3685 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3685 RNA, herein designated VGAM RNA, and which when bound by VGAM3685 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3685 host target proteins.

[51558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3685 gene, herein designated VGAM GENE, on one or more VGAM3685 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51559] It is yet further appreciated that a function of VGAM3685 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3685 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3685 correlate with, and may be deduced from, the identity of the host target genes which VGAM3685 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51560] Nucleotide sequences of the VGAM3685 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3685 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3685 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3685 are further described hereinbelow with reference to Table 1.

[51561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3685 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51562] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3686 (VGAM3686) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51563] VGAM3686 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3686 was detected is described hereinabove with reference to Figs. 2-8.

[51564] VGAM3686 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM3686 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51565] VGAM3686 gene, herein designated VGAM GENE, encodes a VGAM3686 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3686 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3686 precursor RNA is designated SEQ ID:83360, and is provided hereinbelow with reference to the sequence listing part.

[51566] VGAM3686 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51567] An enzyme complex designated DICER COMPLEX, dices the VGAM3686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3686 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3686 RNA is designated SEQ ID:83361, and is provided hereinbelow with reference to the sequence listing part.

[51568] VGAM3686 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3686 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3686 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51569] VGAM3686 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3686 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3686 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3686 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3686 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51570] The complementary binding of VGAM3686 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3686 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3686 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3686 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51571] It is appreciated that VGAM3686 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3686 host target genes. The mRNA of each one of this plurality of VGAM3686 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3686 RNA, herein designated VGAM RNA, and which when bound by VGAM3686 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3686 host target proteins.

[51572] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3686 gene, herein designated VGAM GENE, on one or more VGAM3686 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51573] It is yet further appreciated that a function of VGAM3686 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3686 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM3686 correlate with, and may be deduced from, the identity of the host target genes which VGAM3686 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51574] Nucleotide sequences of the VGAM3686 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3686 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3686 are further described hereinbelow with reference to Table 1.

[51575] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3686 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51576] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3687 (VGAM3687) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51577] VGAM3687 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3687 was detected is described hereinabove with reference to Figs. 2-8.

[51578] VGAM3687 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM3687 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51579] VGAM3687 gene, herein designated VGAM GENE, encodes

a VGAM3687 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3687 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3687 precursor RNA is designated SEQ ID:83367, and is provided hereinbelow with reference to the sequence listing part.

[51580] VGAM3687 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51581] An enzyme complex designated DICER COMPLEX, dices the VGAM3687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3687 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3687 RNA is designated SEQ ID:83368, and is provided hereinbelow with reference to the sequence listing part.

[51582] VGAM3687 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3687 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3687 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51583] VGAM3687 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3687 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3687 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3687 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3687 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51584] The complementary binding of VGAM3687 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3687 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3687 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3687 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[51585] It is appreciated that VGAM3687 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3687 host target genes. The mRNA of each one of this plurality of VGAM3687 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3687 RNA, herein designated VGAM RNA, and which when bound by VGAM3687 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3687 host target proteins.

[51586] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3687 gene, herein designated VGAM GENE, on one or more VGAM3687 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51587] It is yet further appreciated that a function of VGAM3687 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3687 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3687 correlate with, and may be deduced from, the identity of the host target genes which VGAM3687 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51588] Nucleotide sequences of the VGAM3687 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3687 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3687 are further described hereinbelow with reference to Table 1.

[51589] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3687 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51590] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3688 (VGAM3688) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51591] VGAM3688 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3688 was detected is described hereinabove with reference to Figs. 2-8.

[51592] VGAM3688 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie virus. VGAM3688 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51593] VGAM3688 gene, herein designated VGAM GENE, encodes a VGAM3688 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3688 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3688 precursor RNA is designated SEQ ID:83377, and is provided hereinbelow with reference to the sequence listing part.

[51594] VGAM3688 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51595] An enzyme complex designated DICER COMPLEX, dices the VGAM3688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3688 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3688 RNA is designated SEQ ID:83378, and is provided hereinbelow with reference to the sequence listing part.

[51596] VGAM3688 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3688 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3688 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51597] VGAM3688 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3688 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3688 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3688 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3688 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51598] The complementary binding of VGAM3688 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3688 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3688 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3688 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51599] It is appreciated that VGAM3688 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3688 host target genes. The mRNA of each one of this plurality of VGAM3688 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3688 RNA, herein designated VGAM RNA, and which when bound by VGAM3688 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3688 host target proteins.

[51600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3688 gene, herein designated VGAM GENE, on one or more VGAM3688 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51601] It is yet further appreciated that a function of VGAM3688 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3688 include diagnosis, prevention and treatment of viral infection by Infectious flacherie virus. Specific functions, and accordingly utilities, of VGAM3688 correlate with, and may be deduced from, the identity of the host target genes which VGAM3688 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51602] Nucleotide sequences of the VGAM3688 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3688 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3688 are further described hereinbelow with reference to Table 1.

[51603] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3688 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51604] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3689 (VGAM3689) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51605] VGAM3689 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3689 was detected is described hereinabove with reference to Figs. 2-8.

[51606] VGAM3689 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3689 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51607] VGAM3689 gene, herein designated VGAM GENE, encodes a VGAM3689 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3689 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3689 precursor RNA is designated SEQ ID:83385, and is provided hereinbelow with reference to the sequence listing part.

[51608] VGAM3689 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51609] An enzyme complex designated DICER COMPLEX, dices the VGAM3689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3689 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3689 RNA is designated SEQ ID:83386, and is provided hereinbelow with reference to the sequence listing part.

[51610] VGAM3689 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3689 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3689 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51611] VGAM3689 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3689 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3689 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3689 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3689 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51612] The complementary binding of VGAM3689 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3689 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3689 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3689 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51613] It is appreciated that VGAM3689 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3689 host target genes. The mRNA of each one of this plurality of VGAM3689 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3689 RNA, herein designated VGAM RNA, and which when bound by VGAM3689 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3689 host target proteins.

[51614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3689 gene, herein designated VGAM GENE, on one or more VGAM3689 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51615] It is yet further appreciated that a function of VGAM3689 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3689 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3689 correlate with, and may be deduced from, the identity of the host target genes which VGAM3689 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51616] Nucleotide sequences of the VGAM3689 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3689 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3689 are further described hereinbelow with reference to Table 1.

[51617] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3689 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51618] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3690 (VGAM3690) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51619] VGAM3690 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3690 was detected is described hereinabove with reference to Figs. 2–8.

[51620] VGAM3690 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid herpesvirus 4. VGAM3690 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51621] VGAM3690 gene, herein designated VGAM GENE, encodes a VGAM3690 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3690 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3690 precursor RNA is designated SEQ ID:83389, and is provided hereinbelow with reference to the sequence listing part.

[51622] VGAM3690 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51623] An enzyme complex designated DICER COMPLEX, dices the VGAM3690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3690 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3690 RNA is designated SEQ ID:83390, and is provided hereinbelow with reference to the sequence listing part.

[51624] VGAM3690 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3690 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3690 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51625] VGAM3690 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3690 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3690 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3690 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3690 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51626] The complementary binding of VGAM3690 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3690 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3690 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3690 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51627] It is appreciated that VGAM3690 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3690 host target genes. The mRNA of each one of this plurality of VGAM3690 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3690 RNA, herein designated VGAM RNA, and which when bound by VGAM3690 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3690 host target proteins.

[51628] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3690 gene, herein designated VGAM GENE, on one or more VGAM3690 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [51629] It is yet further appreciated that a function of VGAM3690 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3690 include diagnosis, prevention and treatment of viral infection by Murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3690 correlate with, and may be deduced from, the identity of the host target genes which VGAM3690 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [51630] Nucleotide sequences of the VGAM3690 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3690 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3690 are further described hereinbelow with reference to Table 1.
- [51631] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3690 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51632] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3691 (VGAM3691) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51633] VGAM3691 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3691 was detected is described hereinabove with reference to Figs. 2-8.

[51634] VGAM3691 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichomonas vaginalis virus 3. VGAM3691 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51635] VGAM3691 gene, herein designated VGAM GENE, encodes a VGAM3691 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3691 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3691 precursor RNA is designated SEQ ID:83413, and is provided hereinbelow with reference to the sequence listing part.

[51636] VGAM3691 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51637] An enzyme complex designated DICER COMPLEX, dices the VGAM3691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3691 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3691 RNA is designated SEQ ID:83414, and is provided hereinbelow with reference to the sequence listing part.

[51638] VGAM3691 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3691 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3691 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51639] VGAM3691 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3691 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3691 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3691 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3691 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51640] The complementary binding of VGAM3691 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3691 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3691 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3691 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51641] It is appreciated that VGAM3691 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3691 host target genes. The mRNA of

each one of this plurality of VGAM3691 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3691 RNA, herein designated VGAM RNA, and which when bound by VGAM3691 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3691 host target proteins.

[51642] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3691 gene, herein designated VGAM GENE, on one or more VGAM3691 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[51643] It is yet further appreciated that a function of VGAM3691 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3691 include diagnosis, prevention and treatment of viral infection by *Trichomonas vaginalis* virus 3. Specific functions, and accordingly utilities, of VGAM3691 correlate with, and may be deduced from, the identity of the host target genes which VGAM3691 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51644] Nucleotide sequences of the VGAM3691 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3691 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3691 are further described hereinbelow with reference to Table 1.

[51645] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3691 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[51646] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3692 (VGAM3692) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51647] VGAM3692 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3692 was detected is described hereinabove with reference to Figs. 2–8.

[51648] VGAM3692 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid herpesvirus 1. VGAM3692 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51649] VGAM3692 gene, herein designated VGAM GENE, encodes a VGAM3692 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3692 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3692 precursor RNA is designated SEQ ID:83449, and is provided hereinbelow with reference to the sequence listing part.

[51650] VGAM3692 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51651] An enzyme complex designated DICER COMPLEX, dices the VGAM3692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3692 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3692 RNA is designated SEQ ID:83450,

and is provided hereinbelow with reference to the sequence listing part.

[51652] VGAM3692 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3692 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3692 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51653] VGAM3692 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3692 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3692 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3692 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3692 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51654] The complementary binding of VGAM3692 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3692 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3692 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3692 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51655] It is appreciated that VGAM3692 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3692 host target genes. The mRNA of each one of this plurality of VGAM3692 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3692 RNA, herein designated VGAM RNA, and which when bound by VGAM3692 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3692 host target proteins.

[51656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3692 gene, herein designated VGAM GENE, on one or more VGAM3692 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51657] It is yet further appreciated that a function of VGAM3692 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3692 include diagnosis, prevention and treatment of viral infection by Ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3692 correlate with, and may be deduced from, the identity of the host target genes which VGAM3692 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51658] Nucleotide sequences of the VGAM3692 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3692 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3692 are further described hereinbelow with reference to Table 1.

[51659] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3692 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51660] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3693 (VGAM3693) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51661] VGAM3693 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3693 was detected is described hereinabove with reference to Figs. 2–8.

[51662] VGAM3693 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM3693 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51663] VGAM3693 gene, herein designated VGAM GENE, encodes a VGAM3693 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3693 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3693 precu-

sor RNA is designated SEQ ID:83453, and is provided hereinbelow with reference to the sequence listing part.

[51664] VGAM3693 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51665] An enzyme complex designated DICER COMPLEX, dices the VGAM3693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3693 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3693 RNA is designated SEQ ID:83454, and is provided hereinbelow with reference to the se-

quence listing part.

[51666] VGAM3693 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3693 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3693 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51667] VGAM3693 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3693 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3693 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3693 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3693 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51668] The complementary binding of VGAM3693 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3693 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3693 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3693 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51669] It is appreciated that VGAM3693 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3693 host target genes. The mRNA of each one of this plurality of VGAM3693 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3693 RNA, herein designated VGAM RNA, and which when bound by VGAM3693 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3693 host target proteins.

[51670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3693 gene, herein designated VGAM GENE, on one or more VGAM3693 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51671] It is yet further appreciated that a function of VGAM3693

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3693 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3693 correlate with, and may be deduced from, the identity of the host target genes which VGAM3693 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51672] Nucleotide sequences of the VGAM3693 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3693 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3693 are further described hereinbelow with reference to Table 1.

[51673] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3693 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51674] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3694 (VGAM3694) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51675] VGAM3694 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3694 was detected is described hereinabove with reference to Figs. 2–8.

[51676] VGAM3694 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM3694 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51677] VGAM3694 gene, herein designated VGAM GENE, encodes a VGAM3694 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3694 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3694 precursor RNA is designated SEQ ID:83475, and is provided

hereinbelow with reference to the sequence listing part.

[51678] VGAM3694 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51679] An enzyme complex designated DICER COMPLEX, dices the VGAM3694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3694 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3694 RNA is designated SEQ ID:83476, and is provided hereinbelow with reference to the sequence listing part.

[51680] VGAM3694 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3694 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3694 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51681] VGAM3694 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3694 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3694 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3694 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3694 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51682] The complementary binding of VGAM3694 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3694 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3694 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3694 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51683] It is appreciated that VGAM3694 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3694 host target genes. The mRNA of each one of this plurality of VGAM3694 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3694 RNA, herein designated VGAM RNA, and which when bound by VGAM3694 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3694 host target proteins.

[51684] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3694 gene, herein designated VGAM GENE, on one or more VGAM3694 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51685] It is yet further appreciated that a function of VGAM3694 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3694 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM3694 correlate with, and may be deduced from, the identity of the host target genes which VGAM3694 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51686] Nucleotide sequences of the VGAM3694 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3694 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3694 are further described hereinbelow with reference to Table 1.

[51687] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3694 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51688] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3695 (VGAM3695) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51689] VGAM3695 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3695 was detected is described hereinabove with reference to Figs. 2–8.

[51690] VGAM3695 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3695 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51691] VGAM3695 gene, herein designated VGAM GENE, encodes a VGAM3695 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3695 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3695 precursor RNA is designated SEQ ID:83640, and is provided hereinbelow with reference to the sequence listing part.

[51692] VGAM3695 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51693] An enzyme complex designated DICER COMPLEX, dices the VGAM3695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3695 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3695 RNA is designated SEQ ID:83641, and is provided hereinbelow with reference to the sequence listing part.

[51694] VGAM3695 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3695 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3695 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51695] VGAM3695 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3695 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3695 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3695 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3695 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51696] The complementary binding of VGAM3695 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3695 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3695 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3695 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51697] It is appreciated that VGAM3695 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3695 host target genes. The mRNA of each one of this plurality of VGAM3695 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3695 RNA, herein designated VGAM

RNA, and which when bound by VGAM3695 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3695 host target proteins.

[51698] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3695 gene, herein designated VGAM GENE, on one or more VGAM3695 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51699] It is yet further appreciated that a function of VGAM3695 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3695 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3695 correlate with, and may be deduced from, the identity of the host target genes which VGAM3695 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51700] Nucleotide sequences of the VGAM3695 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3695 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3695 are further described hereinbelow with reference to Table 1.

[51701] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3695 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51702] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3696 (VGAM3696) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51703] VGAM3696 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3696 was detected is described hereinabove with reference to Figs. 2-8.

[51704] VGAM3696 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3696 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51705] VGAM3696 gene, herein designated VGAM GENE, encodes a VGAM3696 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3696 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3696 precursor RNA is designated SEQ ID:83645, and is provided hereinbelow with reference to the sequence listing part.

[51706] VGAM3696 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51707] An enzyme complex designated DICER COMPLEX, dices the VGAM3696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3696 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3696 RNA is designated SEQ ID:83646, and is provided hereinbelow with reference to the sequence listing part.

[51708] VGAM3696 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3696 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3696 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51709] VGAM3696 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3696 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3696 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3696 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3696 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51710] The complementary binding of VGAM3696 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3696 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3696 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3696 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51711] It is appreciated that VGAM3696 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3696 host target genes. The mRNA of each one of this plurality of VGAM3696 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3696 RNA, herein designated VGAM RNA, and which when bound by VGAM3696 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3696 host target proteins.

[51712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3696 gene, herein designated VGAM GENE, on one or more VGAM3696 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51713] It is yet further appreciated that a function of VGAM3696 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3696 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3696 correlate with, and may be deduced from, the identity of the host target genes which VGAM3696 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51714] Nucleotide sequences of the VGAM3696 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3696 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3696 are further described hereinbelow with reference to Table 1.

[51715] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3696 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51716] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3697 (VGAM3697) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51717] VGAM3697 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3697 was detected is described hereinabove with reference to Figs. 2–8.

[51718] VGAM3697 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Phocoena spinipinnis papillomavirus. VGAM3697 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51719] VGAM3697 gene, herein designated VGAM GENE, encodes a VGAM3697 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3697 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3697 precursor RNA is designated SEQ ID:83651, and is provided hereinbelow with reference to the sequence listing part.

[51720] VGAM3697 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3697 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51721] An enzyme complex designated DICER COMPLEX, dices the VGAM3697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3697 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3697 RNA is designated SEQ ID:83652, and is provided hereinbelow with reference to the sequence listing part.

[51722] VGAM3697 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3697 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3697 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51723] VGAM3697 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3697 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3697 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3697 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3697 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51724] The complementary binding of VGAM3697 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3697 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3697 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3697 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51725] It is appreciated that VGAM3697 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3697 host target genes. The mRNA of each one of this plurality of VGAM3697 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3697 RNA, herein designated VGAM RNA, and which when bound by VGAM3697 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3697 host target proteins.

[51726] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3697 gene, herein designated VGAM GENE, on one or more VGAM3697 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51727] It is yet further appreciated that a function of VGAM3697 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3697 include diagnosis, prevention and treatment of viral infection by *Phocoena spinipinnis* papil-

lomavirus. Specific functions, and accordingly utilities, of VGAM3697 correlate with, and may be deduced from, the identity of the host target genes which VGAM3697 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51728] Nucleotide sequences of the VGAM3697 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3697 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3697 are further described hereinbelow with reference to Table 1.

[51729] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3697 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51730] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3698 (VGAM3698) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[51731] VGAM3698 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3698 was detected is described hereinabove with reference to Figs. 2–8.

[51732] VGAM3698 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3698 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51733] VGAM3698 gene, herein designated VGAM GENE, encodes a VGAM3698 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3698 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3698 precursor RNA is designated SEQ ID:83658, and is provided hereinbelow with reference to the sequence listing part.

[51734] VGAM3698 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3698 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51735] An enzyme complex designated DICER COMPLEX, dices the VGAM3698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3698 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3698 RNA is designated SEQ ID:83659, and is provided hereinbelow with reference to the sequence listing part.

[51736] VGAM3698 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3698 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3698 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51737] VGAM3698 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3698 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3698 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3698 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3698 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51738] The complementary binding of VGAM3698 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3698 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3698 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3698 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51739] It is appreciated that VGAM3698 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3698 host target genes. The mRNA of each one of this plurality of VGAM3698 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3698 RNA, herein designated VGAM RNA, and which when bound by VGAM3698 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3698 host target proteins.

[51740] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3698 gene, herein designated VGAM GENE, on one or more VGAM3698 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51741] It is yet further appreciated that a function of VGAM3698 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3698 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3698

correlate with, and may be deduced from, the identity of the host target genes which VGAM3698 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51742] Nucleotide sequences of the VGAM3698 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3698 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3698 are further described hereinbelow with reference to Table 1.

[51743] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3698 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51744] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3699 (VGAM3699) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[51745] VGAM3699 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3699 was detected is described hereinabove with reference to Figs. 2–8.

[51746] VGAM3699 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV–1. VGAM3699 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51747] VGAM3699 gene, herein designated VGAM GENE, encodes a VGAM3699 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3699 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3699 precursor RNA is designated SEQ ID:83666, and is provided hereinbelow with reference to the sequence listing part.

[51748] VGAM3699 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51749] An enzyme complex designated DICER COMPLEX, dices the VGAM3699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3699 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3699 RNA is designated SEQ ID:83667, and is provided hereinbelow with reference to the sequence listing part.

[51750] VGAM3699 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3699 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3699 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51751] VGAM3699 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3699 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3699 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3699 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3699 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51752] The complementary binding of VGAM3699 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3699 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3699 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3699 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51753] It is appreciated that VGAM3699 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3699 host target genes. The mRNA of each one of this plurality of VGAM3699 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3699 RNA, herein designated VGAM RNA, and which when bound by VGAM3699 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3699 host target proteins.

[51754] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3699 gene, herein designated VGAM GENE, on one or more VGAM3699 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51755] It is yet further appreciated that a function of VGAM3699 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3699 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM3699 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3699 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51756] Nucleotide sequences of the VGAM3699 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3699 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3699 are further described hereinbelow with reference to Table 1.

[51757] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3699 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51758] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3700 (VGAM3700) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51759] VGAM3700 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3700 was detected is described hereinabove with reference to Figs. 2–8.

[51760] VGAM3700 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM3700 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51761] VGAM3700 gene, herein designated VGAM GENE, encodes a VGAM3700 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3700 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3700 precursor RNA is designated SEQ ID:83673, and is provided hereinbelow with reference to the sequence listing part.

[51762] VGAM3700 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51763] An enzyme complex designated DICER COMPLEX, dices the VGAM3700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3700 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3700 RNA is designated SEQ ID:83674, and is provided hereinbelow with reference to the sequence listing part.

[51764] VGAM3700 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3700 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3700 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51765] VGAM3700 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3700 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3700 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3700 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3700 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51766] The complementary binding of VGAM3700 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3700 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3700 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3700 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51767] It is appreciated that VGAM3700 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3700 host target genes. The mRNA of each one of this plurality of VGAM3700 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3700 RNA, herein designated VGAM RNA, and which when bound by VGAM3700 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3700 host target proteins.

[51768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3700 gene, herein designated VGAM GENE, on one or more VGAM3700 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51769] It is yet further appreciated that a function of VGAM3700 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3700 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3700 correlate with, and may be deduced from, the identity of the host target genes which VGAM3700 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[51770] Nucleotide sequences of the VGAM3700 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3700 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3700 are further described hereinbelow with reference to Table 1.

[51771] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3700 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51772] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3701 (VGAM3701) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51773] VGAM3701 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3701 was detected is described hereinabove with reference to Figs. 2–8.

[51774] VGAM3701 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3701 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51775] VGAM3701 gene, herein designated VGAM GENE, encodes a VGAM3701 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3701 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3701 precursor RNA is designated SEQ ID:83688, and is provided hereinbelow with reference to the sequence listing part.

[51776] VGAM3701 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51777] An enzyme complex designated DICER COMPLEX, dices the VGAM3701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3701 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3701 RNA is designated SEQ ID:83689, and is provided hereinbelow with reference to the sequence listing part.

[51778] VGAM3701 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3701 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3701 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51779] VGAM3701 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3701 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3701 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3701 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3701 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[51780] The complementary binding of VGAM3701 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3701 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3701 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3701 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51781] It is appreciated that VGAM3701 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3701 host target genes. The mRNA of each one of this plurality of VGAM3701 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3701 RNA, herein designated VGAM RNA, and which when bound by VGAM3701 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3701 host target proteins.

[51782] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3701 gene, herein designated VGAM GENE, on one or more VGAM3701 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51783] It is yet further appreciated that a function of VGAM3701 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3701 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3701 correlate with, and may be deduced from, the identity of the host target genes which VGAM3701 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[51784] Nucleotide sequences of the VGAM3701 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3701 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3701 are further described hereinbelow with reference to Table 1.

[51785] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3701 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51786] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3702 (VGAM3702) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51787] VGAM3702 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3702 was detected is described hereinabove with reference to Figs. 2–8.

[51788] VGAM3702 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3702 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51789] VGAM3702 gene, herein designated VGAM GENE, encodes a VGAM3702 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3702 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3702 precursor RNA is designated SEQ ID:83702, and is provided hereinbelow with reference to the sequence listing part.

[51790] VGAM3702 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51791] An enzyme complex designated DICER COMPLEX, dices the VGAM3702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3702 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3702 RNA is designated SEQ ID:83703, and is provided hereinbelow with reference to the sequence listing part.

[51792] VGAM3702 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3702 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3702 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[51793] VGAM3702 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3702 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3702 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3702 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3702 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51794] The complementary binding of VGAM3702 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3702 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3702 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3702 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51795] It is appreciated that VGAM3702 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3702 host target genes. The mRNA of each one of this plurality of VGAM3702 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3702 RNA, herein designated VGAM RNA, and which when bound by VGAM3702 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3702 host target proteins.

[51796] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3702 gene, herein designated VGAM GENE, on one

or more VGAM3702 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51797] It is yet further appreciated that a function of VGAM3702 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3702 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3702 correlate with, and may be deduced from, the identity of the host target genes which VGAM3702 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51798] Nucleotide sequences of the VGAM3702 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3702 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3702 are further described hereinbelow with reference to Table 1.

[51799] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3702 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51800] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3703 (VGAM3703) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51801] VGAM3703 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3703 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[51802] VGAM3703 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3.

VGAM3703 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51803] VGAM3703 gene, herein designated VGAM GENE, encodes a VGAM3703 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3703 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3703 precursor RNA is designated SEQ ID:83720, and is provided hereinbelow with reference to the sequence listing part.

[51804] VGAM3703 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51805] An enzyme complex designated DICER COMPLEX, dices the VGAM3703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3703 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3703 RNA is designated SEQ ID:83721, and is provided hereinbelow with reference to the sequence listing part.

[51806] VGAM3703 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3703 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3703 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51807] VGAM3703 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3703 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3703 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3703 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3703 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51808] The complementary binding of VGAM3703 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3703 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3703 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3703 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51809] It is appreciated that VGAM3703 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3703 host target genes. The mRNA of each one of this plurality of VGAM3703 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3703 RNA, herein designated VGAM RNA, and which when bound by VGAM3703 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3703 host target proteins.

[51810] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3703 gene, herein designated VGAM GENE, on one or more VGAM3703 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51811] It is yet further appreciated that a function of VGAM3703 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3703 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3703 correlate with, and may be deduced from, the identity of the host target genes which VGAM3703 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51812] Nucleotide sequences of the VGAM3703 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3703 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3703 are further described hereinbelow with reference to Table 1.

[51813] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3703 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51814] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3704 (VGAM3704) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51815] VGAM3704 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3704 was detected is described hereinabove with reference to Figs. 2-8.

[51816] VGAM3704 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM3704 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51817] VGAM3704 gene, herein designated VGAM GENE, encodes a VGAM3704 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3704 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3704 precursor RNA is designated SEQ ID:83741, and is provided hereinbelow with reference to the sequence listing part.

[51818] VGAM3704 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[51819] An enzyme complex designated DICER COMPLEX, dices the VGAM3704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3704 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3704 RNA is designated SEQ ID:83742, and is provided hereinbelow with reference to the sequence listing part.

[51820] VGAM3704 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3704 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3704 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51821] VGAM3704 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3704 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3704 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3704 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3704 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51822] The complementary binding of VGAM3704 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3704 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3704 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3704 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51823] It is appreciated that VGAM3704 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3704 host target genes. The mRNA of each one of this plurality of VGAM3704 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3704 RNA, herein designated VGAM RNA, and which when bound by VGAM3704 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3704 host target proteins.

[51824] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3704 gene, herein designated VGAM GENE, on one or more VGAM3704 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51825] It is yet further appreciated that a function of VGAM3704 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3704 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3704 correlate with, and may be deduced from, the identity of the host target genes which VGAM3704 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51826] Nucleotide sequences of the VGAM3704 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3704 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3704 are further described hereinbelow with reference to Table 1.

[51827] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3704 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51828] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3705 (VGAM3705) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51829] VGAM3705 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3705 was detected is described hereinabove with reference to Figs. 2-8.

[51830] VGAM3705 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cherry mottle leaf virus. VGAM3705 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51831] VGAM3705 gene, herein designated VGAM GENE, encodes a VGAM3705 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3705 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3705 precursor RNA is designated SEQ ID:83751, and is provided hereinbelow with reference to the sequence listing part.

[51832] VGAM3705 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51833] An enzyme complex designated DICER COMPLEX, dices the VGAM3705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3705 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3705 RNA is designated SEQ ID:83752, and is provided hereinbelow with reference to the sequence listing part.

[51834] VGAM3705 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3705 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3705 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51835] VGAM3705 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3705 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3705 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3705 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3705 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51836] The complementary binding of VGAM3705 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3705 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3705 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3705 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51837] It is appreciated that VGAM3705 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3705 host target genes. The mRNA of each one of this plurality of VGAM3705 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3705 RNA, herein designated VGAM RNA, and which when bound by VGAM3705 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3705 host target proteins.

[51838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3705 gene, herein designated VGAM GENE, on one or more VGAM3705 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51839] It is yet further appreciated that a function of VGAM3705 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3705 include diagnosis, prevention and treatment of viral infection by Cherry mottle leaf virus. Specific functions, and accordingly utilities, of VGAM3705 correlate with, and may be deduced from, the identity of the host target genes which VGAM3705 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51840] Nucleotide sequences of the VGAM3705 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3705 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3705 are further described hereinbelow with reference to Table 1.

[51841] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3705 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51842] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3706 (VGAM3706) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51843] VGAM3706 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3706 was detected is described hereinabove with reference to Figs. 2-8.

[51844] VGAM3706 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Little cherry virus.

VGAM3706 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51845] VGAM3706 gene, herein designated VGAM GENE, encodes a VGAM3706 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3706 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3706 precursor RNA is designated SEQ ID:83763, and is provided hereinbelow with reference to the sequence listing part.

[51846] VGAM3706 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51847] An enzyme complex designated DICER COMPLEX, dices

the VGAM3706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3706 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3706 RNA is designated SEQ ID:83764, and is provided hereinbelow with reference to the sequence listing part.

[51848] VGAM3706 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3706 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3706 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51849] VGAM3706 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3706 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3706 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3706 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3706 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51850] The complementary binding of VGAM3706 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3706 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3706 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3706 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51851] It is appreciated that VGAM3706 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3706 host target genes. The mRNA of each one of this plurality of VGAM3706 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3706 RNA, herein designated VGAM RNA, and which when bound by VGAM3706 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3706 host target proteins.

[51852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3706 gene, herein designated VGAM GENE, on one or more VGAM3706 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51853] It is yet further appreciated that a function of VGAM3706 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3706 include diagnosis, prevention and treatment of viral infection by Little cherry virus. Specific functions, and accordingly utilities, of VGAM3706 correlate with, and may be deduced from, the identity of the host target genes which VGAM3706 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51854] Nucleotide sequences of the VGAM3706 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3706 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3706 are further described hereinbelow with reference to Table 1.

[51855] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3706 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51856] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3707 (VGAM3707) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51857] VGAM3707 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3707 was detected is described hereinabove with reference to Figs. 2-8.

[51858] VGAM3707 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3707 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51859] VGAM3707 gene, herein designated VGAM GENE, encodes a VGAM3707 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3707 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3707 precursor RNA is designated SEQ ID:83778, and is provided hereinbelow with reference to the sequence listing part.

[51860] VGAM3707 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51861] An enzyme complex designated DICER COMPLEX, dices the VGAM3707 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3707 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3707 RNA is designated SEQ ID:83779, and is provided hereinbelow with reference to the sequence listing part.

[51862] VGAM3707 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3707 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3707 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51863] VGAM3707 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3707 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3707 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3707 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3707 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51864] The complementary binding of VGAM3707 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3707 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3707

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3707 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51865] It is appreciated that VGAM3707 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3707 host target genes. The mRNA of each one of this plurality of VGAM3707 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3707 RNA, herein designated VGAM RNA, and which when bound by VGAM3707 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3707 host target proteins.

[51866] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3707 gene, herein designated VGAM GENE, on one or more VGAM3707 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51867] It is yet further appreciated that a function of VGAM3707 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3707 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3707 correlate with, and may be deduced from, the identity of the host target genes which VGAM3707 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51868] Nucleotide sequences of the VGAM3707 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3707 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3707 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3707 are further described hereinbelow with reference to Table 1.

[51869] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3707 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51870] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3708 (VGAM3708) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51871] VGAM3708 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3708 was detected is described hereinabove with reference to Figs. 2-8.

[51872] VGAM3708 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat streak mosaic virus. VGAM3708 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[51873] VGAM3708 gene, herein designated VGAM GENE, encodes a VGAM3708 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3708 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3708 precursor RNA is designated SEQ ID:83785, and is provided hereinbelow with reference to the sequence listing part.

[51874] VGAM3708 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51875] An enzyme complex designated DICER COMPLEX, dices the VGAM3708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3708 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3708 RNA is designated SEQ ID:83786, and is provided hereinbelow with reference to the sequence listing part.

[51876] VGAM3708 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3708 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3708 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51877] VGAM3708 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3708 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3708 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3708 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3708 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51878] The complementary binding of VGAM3708 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3708 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3708 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3708 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51879] It is appreciated that VGAM3708 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3708 host target genes. The mRNA of each one of this plurality of VGAM3708 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3708 RNA, herein designated VGAM RNA, and which when bound by VGAM3708 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3708 host target proteins.

[51880] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3708 gene, herein designated VGAM GENE, on one or more VGAM3708 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51881] It is yet further appreciated that a function of VGAM3708 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3708 include diagnosis, prevention and treatment of viral infection by Wheat streak mosaic virus. Specific functions, and accordingly utilities, of VGAM3708 correlate with, and may be deduced from, the identity of the host target genes which VGAM3708 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51882] Nucleotide sequences of the VGAM3708 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3708 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3708 are further

described hereinbelow with reference to Table 1.

[51883] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3708 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51884] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3709 (VGAM3709) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51885] VGAM3709 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3709 was detected is described hereinabove with reference to Figs. 2-8.

[51886] VGAM3709 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM3709 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51887] VGAM3709 gene, herein designated VGAM GENE, encodes a VGAM3709 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3709 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3709 precursor RNA is designated SEQ ID:83791, and is provided hereinbelow with reference to the sequence listing part.

[51888] VGAM3709 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51889] An enzyme complex designated DICER COMPLEX, dices the VGAM3709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3709 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3709 RNA is designated SEQ ID:83792, and is provided hereinbelow with reference to the sequence listing part.

[51890] VGAM3709 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3709 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3709 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51891] VGAM3709 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3709 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3709 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3709 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3709 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51892] The complementary binding of VGAM3709 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3709 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3709 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3709 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51893] It is appreciated that VGAM3709 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3709 host target genes. The mRNA of each one of this plurality of VGAM3709 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3709 RNA, herein designated VGAM RNA, and which when bound by VGAM3709 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3709 host target proteins.

[51894] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3709 gene, herein designated VGAM GENE, on one or more VGAM3709 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51895] It is yet further appreciated that a function of VGAM3709 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3709 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM3709 correlate with, and may be deduced from, the identity of the host target genes which VGAM3709 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51896] Nucleotide sequences of the VGAM3709 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3709 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3709 are further described hereinbelow with reference to Table 1.

[51897] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3709 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51898] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3710 (VGAM3710) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51899] VGAM3710 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3710 was detected is described hereinabove with reference to Figs. 2-8.

[51900] VGAM3710 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3710 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51901] VGAM3710 gene, herein designated VGAM GENE, encodes

a VGAM3710 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3710 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3710 precursor RNA is designated SEQ ID:83895, and is provided hereinbelow with reference to the sequence listing part.

[51902] VGAM3710 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51903] An enzyme complex designated DICER COMPLEX, dices the VGAM3710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3710 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3710 RNA is designated SEQ ID:83896, and is provided hereinbelow with reference to the sequence listing part.

[51904] VGAM3710 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3710 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3710 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51905] VGAM3710 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3710 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3710 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3710 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3710 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51906] The complementary binding of VGAM3710 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3710 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3710 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3710 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[51907] It is appreciated that VGAM3710 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3710 host target genes. The mRNA of each one of this plurality of VGAM3710 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3710 RNA, herein designated VGAM RNA, and which when bound by VGAM3710 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3710 host target proteins.

[51908] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3710 gene, herein designated VGAM GENE, on one or more VGAM3710 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51909] It is yet further appreciated that a function of VGAM3710 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3710 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3710 correlate with, and may be deduced from, the identity of the host target genes which VGAM3710 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51910] Nucleotide sequences of the VGAM3710 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3710 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3710 are further described hereinbelow with reference to Table 1.

[51911] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3710 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51912] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3711 (VGAM3711) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51913] VGAM3711 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3711 was detected is described hereinabove with reference to Figs. 2-8.

[51914] VGAM3711 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet soil-borne mosaic virus. VGAM3711 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51915] VGAM3711 gene, herein designated VGAM GENE, encodes a VGAM3711 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3711 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3711 precursor RNA is designated SEQ ID:83898, and is provided hereinbelow with reference to the sequence listing part.

[51916] VGAM3711 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51917] An enzyme complex designated DICER COMPLEX, dices the VGAM3711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3711 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3711 RNA is designated SEQ ID:83899, and is provided hereinbelow with reference to the sequence listing part.

[51918] VGAM3711 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3711 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3711 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51919] VGAM3711 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3711 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3711 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3711 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3711 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51920] The complementary binding of VGAM3711 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3711 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3711 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3711 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51921] It is appreciated that VGAM3711 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3711 host target genes. The mRNA of each one of this plurality of VGAM3711 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3711 RNA, herein designated VGAM RNA, and which when bound by VGAM3711 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3711 host target proteins.

[51922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3711 gene, herein designated VGAM GENE, on one or more VGAM3711 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51923] It is yet further appreciated that a function of VGAM3711 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3711 include diagnosis, prevention and treatment of viral infection by Beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM3711 correlate with, and may be deduced from, the identity of the host target genes which VGAM3711 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51924] Nucleotide sequences of the VGAM3711 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3711 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3711 are further described hereinbelow with reference to Table 1.

[51925] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3711 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51926] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3712 (VGAM3712) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51927] VGAM3712 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3712 was detected is described hereinabove with reference to Figs. 2-8.

[51928] VGAM3712 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3712 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51929] VGAM3712 gene, herein designated VGAM GENE, encodes a VGAM3712 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3712 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3712 precursor RNA is designated SEQ ID:83924, and is provided hereinbelow with reference to the sequence listing part.

[51930] VGAM3712 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51931] An enzyme complex designated DICER COMPLEX, dices the VGAM3712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3712 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3712 RNA is designated SEQ ID:83925, and is provided hereinbelow with reference to the sequence listing part.

[51932] VGAM3712 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3712 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3712 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51933] VGAM3712 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3712 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3712 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3712 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3712 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51934] The complementary binding of VGAM3712 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3712 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3712 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3712 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51935] It is appreciated that VGAM3712 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3712 host target genes. The mRNA of each one of this plurality of VGAM3712 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3712 RNA, herein designated VGAM RNA, and which when bound by VGAM3712 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3712 host target proteins.

[51936] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3712 gene, herein designated VGAM GENE, on one or more VGAM3712 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51937] It is yet further appreciated that a function of VGAM3712 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3712 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3712 correlate with, and may be deduced from, the identity of the host target genes which VGAM3712 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51938] Nucleotide sequences of the VGAM3712 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3712 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3712 are further described hereinbelow with reference to Table 1.

[51939] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3712 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51940] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3713 (VGAM3713) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51941] VGAM3713 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3713 was detected is described hereinabove with reference to Figs. 2–8.

[51942] VGAM3713 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM3713 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51943] VGAM3713 gene, herein designated VGAM GENE, encodes a VGAM3713 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3713 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3713 precursor RNA is designated SEQ ID:83932, and is provided hereinbelow with reference to the sequence listing part.

[51944] VGAM3713 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51945] An enzyme complex designated DICER COMPLEX, dices the VGAM3713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3713 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3713 RNA is designated SEQ ID:83933, and is provided hereinbelow with reference to the sequence listing part.

[51946] VGAM3713 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3713 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3713 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51947] VGAM3713 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3713 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3713 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3713 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3713 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51948] The complementary binding of VGAM3713 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3713 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3713 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3713 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51949] It is appreciated that VGAM3713 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3713 host target genes. The mRNA of each one of this plurality of VGAM3713 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3713 RNA, herein designated VGAM RNA, and which when bound by VGAM3713 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3713 host target proteins.

[51950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3713 gene, herein designated VGAM GENE, on one or more VGAM3713 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[51951] It is yet further appreciated that a function of VGAM3713 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3713 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM3713 correlate with, and may be deduced from, the identity of the host target genes which VGAM3713 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51952] Nucleotide sequences of the VGAM3713 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3713 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3713 are further described hereinbelow with reference to Table 1.

[51953] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3713 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51954] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3714 (VGAM3714) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51955] VGAM3714 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3714 was detected is described hereinabove with reference to Figs. 2-8.

[51956] VGAM3714 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3714 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51957] VGAM3714 gene, herein designated VGAM GENE, encodes a VGAM3714 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3714 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3714 precursor RNA is designated SEQ ID:83973, and is provided hereinbelow with reference to the sequence listing part.

[51958] VGAM3714 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51959] An enzyme complex designated DICER COMPLEX, dices the VGAM3714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3714 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3714 RNA is designated SEQ ID:83974, and is provided hereinbelow with reference to the sequence listing part.

[51960] VGAM3714 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3714 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3714 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51961] VGAM3714 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3714 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3714 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3714 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3714 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51962] The complementary binding of VGAM3714 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3714 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3714 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3714 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51963] It is appreciated that VGAM3714 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3714 host target genes. The mRNA of

each one of this plurality of VGAM3714 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3714 RNA, herein designated VGAM RNA, and which when bound by VGAM3714 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3714 host target proteins.

[51964] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3714 gene, herein designated VGAM GENE, on one or more VGAM3714 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[51965] It is yet further appreciated that a function of VGAM3714 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3714 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3714 correlate with, and may be deduced from, the identity of the host target genes which VGAM3714 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51966] Nucleotide sequences of the VGAM3714 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3714 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3714 are further described hereinbelow with reference to Table 1.

[51967] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3714 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[51968] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3715 (VGAM3715) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51969] VGAM3715 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3715 was detected is described hereinabove with reference to Figs. 2–8.

[51970] VGAM3715 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3715 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51971] VGAM3715 gene, herein designated VGAM GENE, encodes a VGAM3715 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3715 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3715 precursor RNA is designated SEQ ID:83978, and is provided hereinbelow with reference to the sequence listing part.

[51972] VGAM3715 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51973] An enzyme complex designated DICER COMPLEX, dices the VGAM3715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3715 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3715 RNA is designated SEQ ID:83979,

and is provided hereinbelow with reference to the sequence listing part.

[51974] VGAM3715 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3715 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3715 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51975] VGAM3715 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3715 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3715 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3715 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3715 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51976] The complementary binding of VGAM3715 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3715 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3715 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3715 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51977] It is appreciated that VGAM3715 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3715 host target genes. The mRNA of each one of this plurality of VGAM3715 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3715 RNA, herein designated VGAM RNA, and which when bound by VGAM3715 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3715 host target proteins.

[51978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3715 gene, herein designated VGAM GENE, on one or more VGAM3715 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51979] It is yet further appreciated that a function of VGAM3715 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3715 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3715 correlate with, and may be deduced from, the identity of the host target genes which VGAM3715 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51980] Nucleotide sequences of the VGAM3715 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3715 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3715 are further described hereinbelow with reference to Table 1.

[51981] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3715 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51982] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3716 (VGAM3716) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51983] VGAM3716 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3716 was detected is described hereinabove with reference to Figs. 2–8.

[51984] VGAM3716 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3716 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51985] VGAM3716 gene, herein designated VGAM GENE, encodes a VGAM3716 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3716 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3716 precu-

sor RNA is designated SEQ ID:84008, and is provided hereinbelow with reference to the sequence listing part.

[51986] VGAM3716 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51987] An enzyme complex designated DICER COMPLEX, dices the VGAM3716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3716 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3716 RNA is designated SEQ ID:84009, and is provided hereinbelow with reference to the se-

quence listing part.

[51988] VGAM3716 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3716 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3716 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[51989] VGAM3716 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3716 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3716 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3716 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3716 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[51990] The complementary binding of VGAM3716 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3716 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3716 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3716 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51991] It is appreciated that VGAM3716 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3716 host target genes. The mRNA of each one of this plurality of VGAM3716 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3716 RNA, herein designated VGAM RNA, and which when bound by VGAM3716 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3716 host target proteins.

[51992] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3716 gene, herein designated VGAM GENE, on one or more VGAM3716 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51993] It is yet further appreciated that a function of VGAM3716 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3716 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3716 correlate with, and may be deduced from, the identity of the host target genes which VGAM3716 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51994] Nucleotide sequences of the VGAM3716 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3716 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3716 are further described hereinbelow with reference to Table 1.

[51995] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3716 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51996] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3717 (VGAM3717) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51997] VGAM3717 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3717 was detected is described hereinabove with reference to Figs. 2–8.

[51998] VGAM3717 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3717 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51999] VGAM3717 gene, herein designated VGAM GENE, encodes a VGAM3717 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3717 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3717 precursor RNA is designated SEQ ID:84011, and is provided hereinbelow with reference to the sequence listing part.

[52000] VGAM3717 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52001] An enzyme complex designated DICER COMPLEX, dices the VGAM3717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3717 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3717 RNA is designated SEQ ID:84012, and is provided hereinbelow with reference to the sequence listing part.

[52002] VGAM3717 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3717 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3717 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52003] VGAM3717 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3717 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3717 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3717 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3717 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52004] The complementary binding of VGAM3717 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3717 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3717 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3717 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52005] It is appreciated that VGAM3717 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3717 host target genes. The mRNA of each one of this plurality of VGAM3717 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3717 RNA, herein designated VGAM

RNA, and which when bound by VGAM3717 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3717 host target proteins.

[52006] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3717 gene, herein designated VGAM GENE, on one or more VGAM3717 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52007] It is yet further appreciated that a function of VGAM3717 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3717 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3717 correlate with, and may be deduced from, the identity of the host target genes which VGAM3717 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52008] Nucleotide sequences of the VGAM3717 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3717 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3717 are further described hereinbelow with reference to Table 1.

[52009] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3717 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52010] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3718 (VGAM3718) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52011] VGAM3718 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3718 was detected is described hereinabove with reference to Figs. 2–8.

[52012] VGAM3718 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3718 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52013] VGAM3718 gene, herein designated VGAM GENE, encodes a VGAM3718 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3718 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3718 precursor RNA is designated SEQ ID:84019, and is provided hereinbelow with reference to the sequence listing part.

[52014] VGAM3718 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52015] An enzyme complex designated DICER COMPLEX, dices the VGAM3718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3718 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3718 RNA is designated SEQ ID:84020, and is provided hereinbelow with reference to the sequence listing part.

[52016] VGAM3718 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3718 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3718 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52017] VGAM3718 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3718 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3718 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3718 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3718 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52018] The complementary binding of VGAM3718 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3718 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3718 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3718 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52019] It is appreciated that VGAM3718 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3718 host target genes. The mRNA of each one of this plurality of VGAM3718 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3718 RNA, herein designated VGAM RNA, and which when bound by VGAM3718 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3718 host target proteins.

[52020] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3718 gene, herein designated VGAM GENE, on one or more VGAM3718 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52021] It is yet further appreciated that a function of VGAM3718 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3718 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3718 correlate with, and may be deduced from, the identity of the host target genes which VGAM3718 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52022] Nucleotide sequences of the VGAM3718 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3718 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3718 are further described hereinbelow with reference to Table 1.

[52023] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3718 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52024] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3719 (VGAM3719) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52025] VGAM3719 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3719 was detected is described hereinabove with reference to Figs. 2–8.

[52026] VGAM3719 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sida golden mosaic virus. VGAM3719 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52027] VGAM3719 gene, herein designated VGAM GENE, encodes a VGAM3719 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3719 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3719 precursor RNA is designated SEQ ID:84046, and is provided hereinbelow with reference to the sequence listing part.

[52028] VGAM3719 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3719 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52029] An enzyme complex designated DICER COMPLEX, dices the VGAM3719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3719 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3719 RNA is designated SEQ ID:84047, and is provided hereinbelow with reference to the sequence listing part.

[52030] VGAM3719 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3719 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3719 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52031] VGAM3719 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3719 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3719 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3719 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3719 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52032] The complementary binding of VGAM3719 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3719 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3719 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3719 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52033] It is appreciated that VGAM3719 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3719 host target genes. The mRNA of each one of this plurality of VGAM3719 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3719 RNA, herein designated VGAM RNA, and which when bound by VGAM3719 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3719 host target proteins.

[52034] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3719 gene, herein designated VGAM GENE, on one or more VGAM3719 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52035] It is yet further appreciated that a function of VGAM3719 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3719 include diagnosis, prevention and treatment of viral infection by Sida golden mosaic virus.

Specific functions, and accordingly utilities, of VGAM3719 correlate with, and may be deduced from, the identity of the host target genes which VGAM3719 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52036] Nucleotide sequences of the VGAM3719 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3719 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3719 are further described hereinbelow with reference to Table 1.

[52037] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3719 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52038] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3720 (VGAM3720) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[52039] VGAM3720 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3720 was detected is described hereinabove with reference to Figs. 2–8.

[52040] VGAM3720 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ryegrass mottle virus. VGAM3720 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52041] VGAM3720 gene, herein designated VGAM GENE, encodes a VGAM3720 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3720 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3720 precursor RNA is designated SEQ ID:84053, and is provided hereinbelow with reference to the sequence listing part.

[52042] VGAM3720 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3720 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52043] An enzyme complex designated DICER COMPLEX, dices the VGAM3720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3720 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3720 RNA is designated SEQ ID:84054, and is provided hereinbelow with reference to the sequence listing part.

[52044] VGAM3720 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3720 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3720 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52045] VGAM3720 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3720 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3720 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3720 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3720 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52046] The complementary binding of VGAM3720 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3720 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3720 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3720 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52047] It is appreciated that VGAM3720 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3720 host target genes. The mRNA of each one of this plurality of VGAM3720 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3720 RNA, herein designated VGAM RNA, and which when bound by VGAM3720 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3720 host target proteins.

[52048] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3720 gene, herein designated VGAM GENE, on one or more VGAM3720 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52049] It is yet further appreciated that a function of VGAM3720 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3720 include diagnosis, prevention and treatment of viral infection by Ryegrass mottle virus. Specific functions, and accordingly utilities, of VGAM3720

correlate with, and may be deduced from, the identity of the host target genes which VGAM3720 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52050] Nucleotide sequences of the VGAM3720 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3720 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3720 are further described hereinbelow with reference to Table 1.

[52051] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3720 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52052] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3721 (VGAM3721) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[52053] VGAM3721 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3721 was detected is described hereinabove with reference to Figs. 2–8.

[52054] VGAM3721 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM3721 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52055] VGAM3721 gene, herein designated VGAM GENE, encodes a VGAM3721 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3721 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3721 precursor RNA is designated SEQ ID:84065, and is provided hereinbelow with reference to the sequence listing part.

[52056] VGAM3721 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52057] An enzyme complex designated DICER COMPLEX, dices the VGAM3721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3721 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3721 RNA is designated SEQ ID:84066, and is provided hereinbelow with reference to the sequence listing part.

[52058] VGAM3721 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3721 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3721 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52059] VGAM3721 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3721 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3721 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3721 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3721 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52060] The complementary binding of VGAM3721 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3721 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3721 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3721 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52061] It is appreciated that VGAM3721 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3721 host target genes. The mRNA of each one of this plurality of VGAM3721 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3721 RNA, herein designated VGAM RNA, and which when bound by VGAM3721 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3721 host target proteins.

[52062] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3721 gene, herein designated VGAM GENE, on one or more VGAM3721 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52063] It is yet further appreciated that a function of VGAM3721 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3721 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3721 correlate with, and may be deduced from, the identity of the

host target genes which VGAM3721 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52064] Nucleotide sequences of the VGAM3721 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3721 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3721 are further described hereinbelow with reference to Table 1.

[52065] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3721 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52066] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3722 (VGAM3722) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52067] VGAM3722 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3722 was detected is described hereinabove with reference to Figs. 2–8.

[52068] VGAM3722 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3722 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52069] VGAM3722 gene, herein designated VGAM GENE, encodes a VGAM3722 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3722 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3722 precursor RNA is designated SEQ ID:84081, and is provided hereinbelow with reference to the sequence listing part.

[52070] VGAM3722 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52071] An enzyme complex designated DICER COMPLEX, dices the VGAM3722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3722 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3722 RNA is designated SEQ ID:84082, and is provided hereinbelow with reference to the sequence listing part.

[52072] VGAM3722 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3722 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3722 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52073] VGAM3722 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3722 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3722 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3722 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3722 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52074] The complementary binding of VGAM3722 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3722 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3722 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3722 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52075] It is appreciated that VGAM3722 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3722 host target genes. The mRNA of each one of this plurality of VGAM3722 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3722 RNA, herein designated VGAM RNA, and which when bound by VGAM3722 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3722 host target proteins.

[52076] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3722 gene, herein designated VGAM GENE, on one or more VGAM3722 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52077] It is yet further appreciated that a function of VGAM3722 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3722 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3722 correlate with, and may be deduced from, the identity of the host target genes which VGAM3722 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[52078] Nucleotide sequences of the VGAM3722 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3722 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3722 are further described hereinbelow with reference to Table 1.

[52079] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3722 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52080] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3723 (VGAM3723) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52081] VGAM3723 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3723 was detected is described hereinabove with reference to Figs. 2–8.

[52082] VGAM3723 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3723 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52083] VGAM3723 gene, herein designated VGAM GENE, encodes a VGAM3723 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3723 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3723 precursor RNA is designated SEQ ID:84099, and is provided hereinbelow with reference to the sequence listing part.

[52084] VGAM3723 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52085] An enzyme complex designated DICER COMPLEX, dices the VGAM3723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3723 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3723 RNA is designated SEQ ID:84100, and is provided hereinbelow with reference to the sequence listing part.

[52086] VGAM3723 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3723 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3723 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52087] VGAM3723 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3723 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3723 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3723 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3723 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[52088] The complementary binding of VGAM3723 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3723 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3723 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3723 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52089] It is appreciated that VGAM3723 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3723 host target genes. The mRNA of each one of this plurality of VGAM3723 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3723 RNA, herein designated VGAM RNA, and which when bound by VGAM3723 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3723 host target proteins.

[52090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3723 gene, herein designated VGAM GENE, on one or more VGAM3723 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52091] It is yet further appreciated that a function of VGAM3723 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3723 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3723 correlate with, and may be deduced from, the identity of the host target genes which VGAM3723 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[52092] Nucleotide sequences of the VGAM3723 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3723 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3723 are further described hereinbelow with reference to Table 1.

[52093] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3723 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52094] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3724 (VGAM3724) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52095] VGAM3724 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3724 was detected is described hereinabove with reference to Figs. 2–8.

[52096] VGAM3724 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cactus virus X.

VGAM3724 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52097] VGAM3724 gene, herein designated VGAM GENE, encodes a VGAM3724 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3724 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3724 precursor RNA is designated SEQ ID:84112, and is provided hereinbelow with reference to the sequence listing part.

[52098] VGAM3724 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52099] An enzyme complex designated DICER COMPLEX, dices the VGAM3724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3724 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3724 RNA is designated SEQ ID:84113, and is provided hereinbelow with reference to the sequence listing part.

[52100] VGAM3724 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3724 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3724 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[52101] VGAM3724 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3724 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3724 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3724 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3724 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52102] The complementary binding of VGAM3724 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3724 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3724 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3724 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52103] It is appreciated that VGAM3724 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3724 host target genes. The mRNA of each one of this plurality of VGAM3724 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3724 RNA, herein designated VGAM RNA, and which when bound by VGAM3724 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3724 host target proteins.

[52104] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3724 gene, herein designated VGAM GENE, on one

or more VGAM3724 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52105] It is yet further appreciated that a function of VGAM3724 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3724 include diagnosis, prevention and treatment of viral infection by Cactus virus X. Specific functions, and accordingly utilities, of VGAM3724 correlate with, and may be deduced from, the identity of the host target genes which VGAM3724 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52106] Nucleotide sequences of the VGAM3724 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3724 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3724 are further described hereinbelow with reference to Table 1.

[52107] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3724 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52108] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3725 (VGAM3725) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52109] VGAM3725 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3725 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[52110] VGAM3725 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3725 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52111] VGAM3725 gene, herein designated VGAM GENE, encodes a VGAM3725 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3725 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3725 precursor RNA is designated SEQ ID:84132, and is provided hereinbelow with reference to the sequence listing part.

[52112] VGAM3725 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52113] An enzyme complex designated DICER COMPLEX, dices the VGAM3725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3725 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3725 RNA is designated SEQ ID:84133, and is provided hereinbelow with reference to the sequence listing part.

[52114] VGAM3725 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3725 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3725 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52115] VGAM3725 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3725 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3725 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3725 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3725 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52116] The complementary binding of VGAM3725 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3725 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3725 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3725 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52117] It is appreciated that VGAM3725 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3725 host target genes. The mRNA of each one of this plurality of VGAM3725 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3725 RNA, herein designated VGAM RNA, and which when bound by VGAM3725 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3725 host target proteins.

[52118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3725 gene, herein designated VGAM GENE, on one or more VGAM3725 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52119] It is yet further appreciated that a function of VGAM3725 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3725 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3725 correlate with, and may be deduced from, the identity of the host target genes which VGAM3725 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52120] Nucleotide sequences of the VGAM3725 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3725 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3725 are further described hereinbelow with reference to Table 1.

[52121] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3725 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52122] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3726 (VGAM3726) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52123] VGAM3726 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3726 was detected is described hereinabove with reference to Figs. 2-8.

[52124] VGAM3726 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM3726 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52125] VGAM3726 gene, herein designated VGAM GENE, encodes a VGAM3726 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3726 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3726 precursor RNA is designated SEQ ID:84162, and is provided hereinbelow with reference to the sequence listing part.

[52126] VGAM3726 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[52127] An enzyme complex designated DICER COMPLEX, dices the VGAM3726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3726 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3726 RNA is designated SEQ ID:84163, and is provided hereinbelow with reference to the sequence listing part.

[52128] VGAM3726 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3726 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3726 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52129] VGAM3726 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3726 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3726 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3726 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3726 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52130] The complementary binding of VGAM3726 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3726 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3726 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3726 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52131] It is appreciated that VGAM3726 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3726 host target genes. The mRNA of each one of this plurality of VGAM3726 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3726 RNA, herein designated VGAM RNA, and which when bound by VGAM3726 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3726 host target proteins.

[52132] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3726 gene, herein designated VGAM GENE, on one or more VGAM3726 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52133] It is yet further appreciated that a function of VGAM3726 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3726 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM3726 correlate with, and may be deduced from, the identity of the host target genes which VGAM3726 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52134] Nucleotide sequences of the VGAM3726 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3726 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3726 are further described hereinbelow with reference to Table 1.

[52135] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3726 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52136] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3727 (VGAM3727) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52137] VGAM3727 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3727 was detected is described hereinabove with reference to Figs. 2-8.

[52138] VGAM3727 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine herpesvirus 1. VGAM3727 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52139] VGAM3727 gene, herein designated VGAM GENE, encodes a VGAM3727 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3727 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3727 precursor RNA is designated SEQ ID:84170, and is provided hereinbelow with reference to the sequence listing part.

[52140] VGAM3727 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52141] An enzyme complex designated DICER COMPLEX, dices the VGAM3727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3727 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3727 RNA is designated SEQ ID:84171, and is provided hereinbelow with reference to the sequence listing part.

[52142] VGAM3727 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3727 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3727 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52143] VGAM3727 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3727 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3727 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3727 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3727 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52144] The complementary binding of VGAM3727 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3727 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3727 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3727 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52145] It is appreciated that VGAM3727 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3727 host target genes. The mRNA of each one of this plurality of VGAM3727 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3727 RNA, herein designated VGAM RNA, and which when bound by VGAM3727 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3727 host target proteins.

[52146] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3727 gene, herein designated VGAM GENE, on one or more VGAM3727 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52147] It is yet further appreciated that a function of VGAM3727 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3727 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3727 correlate with, and may be deduced from, the identity of the host target genes which VGAM3727 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52148] Nucleotide sequences of the VGAM3727 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3727 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3727 are further described hereinbelow with reference to Table 1.

[52149] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3727 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52150] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3728 (VGAM3728) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52151] VGAM3728 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3728 was detected is described hereinabove with reference to Figs. 2-8.

[52152] VGAM3728 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1.

VGAM3728 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52153] VGAM3728 gene, herein designated VGAM GENE, encodes a VGAM3728 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3728 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3728 precursor RNA is designated SEQ ID:84181, and is provided hereinbelow with reference to the sequence listing part.

[52154] VGAM3728 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52155] An enzyme complex designated DICER COMPLEX, dices

the VGAM3728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3728 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3728 RNA is designated SEQ ID:84182, and is provided hereinbelow with reference to the sequence listing part.

[52156] VGAM3728 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3728 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3728 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52157] VGAM3728 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3728 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3728 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3728 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3728 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52158] The complementary binding of VGAM3728 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3728 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3728 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3728 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52159] It is appreciated that VGAM3728 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3728 host target genes. The mRNA of each one of this plurality of VGAM3728 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3728 RNA, herein designated VGAM RNA, and which when bound by VGAM3728 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3728 host target proteins.

[52160] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3728 gene, herein designated VGAM GENE, on one or more VGAM3728 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52161] It is yet further appreciated that a function of VGAM3728 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3728 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3728 correlate with, and may be deduced from, the identity of the host target genes which VGAM3728 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52162] Nucleotide sequences of the VGAM3728 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3728 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3728 are further described hereinbelow with reference to Table 1.

[52163] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3728 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52164] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3729 (VGAM3729) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52165] VGAM3729 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3729 was detected is described hereinabove with reference to Figs. 2-8.

[52166] VGAM3729 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini yellow mosaic virus. VGAM3729 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52167] VGAM3729 gene, herein designated VGAM GENE, encodes a VGAM3729 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3729 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3729 precursor RNA is designated SEQ ID:84211, and is provided hereinbelow with reference to the sequence listing part.

[52168] VGAM3729 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52169] An enzyme complex designated DICER COMPLEX, dices the VGAM3729 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3729 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3729 RNA is designated SEQ ID:84212, and is provided hereinbelow with reference to the sequence listing part.

[52170] VGAM3729 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3729 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3729 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52171] VGAM3729 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3729 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3729 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3729 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3729 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52172] The complementary binding of VGAM3729 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3729 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3729

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3729 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52173] It is appreciated that VGAM3729 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3729 host target genes. The mRNA of each one of this plurality of VGAM3729 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3729 RNA, herein designated VGAM RNA, and which when bound by VGAM3729 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3729 host target proteins.

[52174] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3729 gene, herein designated VGAM GENE, on one or more VGAM3729 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52175] It is yet further appreciated that a function of VGAM3729 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3729 include diagnosis, prevention and treatment of viral infection by Zucchini yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM3729 correlate with, and may be deduced from, the identity of the host target genes which VGAM3729 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52176] Nucleotide sequences of the VGAM3729 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3729 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3729 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3729 are further described hereinbelow with reference to Table 1.

[52177] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3729 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52178] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3730 (VGAM3730) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52179] VGAM3730 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3730 was detected is described hereinabove with reference to Figs. 2-8.

[52180] VGAM3730 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3730 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[52181] VGAM3730 gene, herein designated VGAM GENE, encodes a VGAM3730 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3730 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3730 precursor RNA is designated SEQ ID:84234, and is provided hereinbelow with reference to the sequence listing part.

[52182] VGAM3730 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52183] An enzyme complex designated DICER COMPLEX, dices the VGAM3730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3730 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3730 RNA is designated SEQ ID:84235, and is provided hereinbelow with reference to the sequence listing part.

[52184] VGAM3730 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3730 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3730 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52185] VGAM3730 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3730 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3730 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3730 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3730 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52186] The complementary binding of VGAM3730 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3730 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3730 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3730 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52187] It is appreciated that VGAM3730 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3730 host target genes. The mRNA of each one of this plurality of VGAM3730 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3730 RNA, herein designated VGAM RNA, and which when bound by VGAM3730 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3730 host target proteins.

[52188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3730 gene, herein designated VGAM GENE, on one or more VGAM3730 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52189] It is yet further appreciated that a function of VGAM3730 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3730 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3730 correlate with, and may be deduced from, the identity of the host target genes which VGAM3730 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52190] Nucleotide sequences of the VGAM3730 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3730 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3730 are further

described hereinbelow with reference to Table 1.

[52191] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3730 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52192] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3731 (VGAM3731) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52193] VGAM3731 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3731 was detected is described hereinabove with reference to Figs. 2-8.

[52194] VGAM3731 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM3731 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52195] VGAM3731 gene, herein designated VGAM GENE, encodes a VGAM3731 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3731 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3731 precursor RNA is designated SEQ ID:84242, and is provided hereinbelow with reference to the sequence listing part.

[52196] VGAM3731 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52197] An enzyme complex designated DICER COMPLEX, dices the VGAM3731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3731 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3731 RNA is designated SEQ ID:84243, and is provided hereinbelow with reference to the sequence listing part.

[52198] VGAM3731 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3731 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3731 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52199] VGAM3731 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3731 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3731 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3731 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3731 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52200] The complementary binding of VGAM3731 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3731 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3731 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3731 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52201] It is appreciated that VGAM3731 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3731 host target genes. The mRNA of each one of this plurality of VGAM3731 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3731 RNA, herein designated VGAM RNA, and which when bound by VGAM3731 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3731 host target proteins.

[52202] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3731 gene, herein designated VGAM GENE, on one or more VGAM3731 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52203] It is yet further appreciated that a function of VGAM3731 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3731 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3731 correlate with, and may be deduced from, the identity of the host target genes which VGAM3731 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52204] Nucleotide sequences of the VGAM3731 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3731 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3731 are further described hereinbelow with reference to Table 1.

[52205] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3731 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52206] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3732 (VGAM3732) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52207] VGAM3732 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3732 was detected is described hereinabove with reference to Figs. 2-8.

[52208] VGAM3732 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory syncytial virus. VGAM3732 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52209] VGAM3732 gene, herein designated VGAM GENE, encodes

a VGAM3732 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3732 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3732 precursor RNA is designated SEQ ID:84258, and is provided hereinbelow with reference to the sequence listing part.

[52210] VGAM3732 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52211] An enzyme complex designated DICER COMPLEX, dices the VGAM3732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3732 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3732 RNA is designated SEQ ID:84259, and is provided hereinbelow with reference to the sequence listing part.

[52212] VGAM3732 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3732 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3732 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52213] VGAM3732 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3732 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3732 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3732 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3732 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52214] The complementary binding of VGAM3732 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3732 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3732 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3732 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[52215] It is appreciated that VGAM3732 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3732 host target genes. The mRNA of each one of this plurality of VGAM3732 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3732 RNA, herein designated VGAM RNA, and which when bound by VGAM3732 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3732 host target proteins.

[52216] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3732 gene, herein designated VGAM GENE, on one or more VGAM3732 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52217] It is yet further appreciated that a function of VGAM3732 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3732 include diagnosis, prevention and treatment of viral infection by Respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3732 correlate with, and may be deduced from, the identity of the host target genes which VGAM3732 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52218] Nucleotide sequences of the VGAM3732 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3732 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3732 are further described hereinbelow with reference to Table 1.

[52219] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3732 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52220] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3733 (VGAM3733) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52221] VGAM3733 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3733 was detected is described hereinabove with reference to Figs. 2-8.

[52222] VGAM3733 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3733 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52223] VGAM3733 gene, herein designated VGAM GENE, encodes a VGAM3733 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3733 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3733 precursor RNA is designated SEQ ID:84270, and is provided hereinbelow with reference to the sequence listing part.

[52224] VGAM3733 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52225] An enzyme complex designated DICER COMPLEX, dices the VGAM3733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3733 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3733 RNA is designated SEQ ID:84271, and is provided hereinbelow with reference to the sequence listing part.

[52226] VGAM3733 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3733 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3733 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52227] VGAM3733 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3733 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3733 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3733 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3733 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52228] The complementary binding of VGAM3733 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3733 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3733 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3733 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52229] It is appreciated that VGAM3733 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3733 host target genes. The mRNA of each one of this plurality of VGAM3733 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3733 RNA, herein designated VGAM RNA, and which when bound by VGAM3733 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3733 host target proteins.

[52230] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3733 gene, herein designated VGAM GENE, on one or more VGAM3733 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52231] It is yet further appreciated that a function of VGAM3733 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3733 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3733 correlate with, and may be deduced from, the identity of the host target genes which VGAM3733 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52232] Nucleotide sequences of the VGAM3733 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3733 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3733 are further described hereinbelow with reference to Table 1.

[52233] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3733 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52234] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3734 (VGAM3734) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52235] VGAM3734 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3734 was detected is described hereinabove with reference to Figs. 2-8.

[52236] VGAM3734 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3734 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52237] VGAM3734 gene, herein designated VGAM GENE, encodes a VGAM3734 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3734 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3734 precursor RNA is designated SEQ ID:84277, and is provided hereinbelow with reference to the sequence listing part.

[52238] VGAM3734 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52239] An enzyme complex designated DICER COMPLEX, dices the VGAM3734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3734 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3734 RNA is designated SEQ ID:84278, and is provided hereinbelow with reference to the sequence listing part.

[52240] VGAM3734 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3734 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3734 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52241] VGAM3734 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3734 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3734 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3734 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3734 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52242] The complementary binding of VGAM3734 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3734 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3734 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3734 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52243] It is appreciated that VGAM3734 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3734 host target genes. The mRNA of each one of this plurality of VGAM3734 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3734 RNA, herein designated VGAM RNA, and which when bound by VGAM3734 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3734 host target proteins.

[52244] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3734 gene, herein designated VGAM GENE, on one or more VGAM3734 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52245] It is yet further appreciated that a function of VGAM3734 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3734 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3734 correlate with, and may be deduced from, the identity of the host target genes which VGAM3734 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52246] Nucleotide sequences of the VGAM3734 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3734 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3734 are further described hereinbelow with reference to Table 1.

[52247] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3734 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52248] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3735 (VGAM3735) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52249] VGAM3735 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3735 was detected is described hereinabove with reference to Figs. 2–8.

[52250] VGAM3735 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3735 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52251] VGAM3735 gene, herein designated VGAM GENE, encodes a VGAM3735 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3735 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3735 precursor RNA is designated SEQ ID:84287, and is provided hereinbelow with reference to the sequence listing part.

[52252] VGAM3735 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52253] An enzyme complex designated DICER COMPLEX, dices the VGAM3735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3735 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3735 RNA is designated SEQ ID:84288, and is provided hereinbelow with reference to the sequence listing part.

[52254] VGAM3735 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3735 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3735 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52255] VGAM3735 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3735 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3735 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3735 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3735 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52256] The complementary binding of VGAM3735 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3735 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3735 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3735 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52257] It is appreciated that VGAM3735 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3735 host target genes. The mRNA of each one of this plurality of VGAM3735 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3735 RNA, herein designated VGAM RNA, and which when bound by VGAM3735 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3735 host target proteins.

[52258] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3735 gene, herein designated VGAM GENE, on one or more VGAM3735 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[52259] It is yet further appreciated that a function of VGAM3735 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3735 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3735 correlate with, and may be deduced from, the identity of the host target genes which VGAM3735 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52260] Nucleotide sequences of the VGAM3735 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3735 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3735 are further described hereinbelow with reference to Table 1.

[52261] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3735 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52262] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3736 (VGAM3736) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52263] VGAM3736 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3736 was detected is described hereinabove with reference to Figs. 2-8.

[52264] VGAM3736 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3736 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52265] VGAM3736 gene, herein designated VGAM GENE, encodes a VGAM3736 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3736 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3736 precursor RNA is designated SEQ ID:84291, and is provided hereinbelow with reference to the sequence listing part.

[52266] VGAM3736 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52267] An enzyme complex designated DICER COMPLEX, dices the VGAM3736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3736 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide se-

quence of VGAM3736 RNA is designated SEQ ID:66795, and is provided hereinbelow with reference to the sequence listing part.

[52268] VGAM3736 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3736 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3736 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52269] VGAM3736 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3736 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3736 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3736 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3736 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52270] The complementary binding of VGAM3736 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3736 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3736 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3736 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52271] It is appreciated that VGAM3736 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3736 host target genes. The mRNA of

each one of this plurality of VGAM3736 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3736 RNA, herein designated VGAM RNA, and which when bound by VGAM3736 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3736 host target proteins.

[52272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3736 gene, herein designated VGAM GENE, on one or more VGAM3736 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[52273] It is yet further appreciated that a function of VGAM3736 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3736 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3736 correlate with, and may be deduced from, the identity of the host target genes which VGAM3736 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52274] Nucleotide sequences of the VGAM3736 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3736 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3736 are further described hereinbelow with reference to Table 1.

[52275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3736 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[52276] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3737 (VGAM3737) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52277] VGAM3737 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3737 was detected is described hereinabove with reference to Figs. 2–8.

[52278] VGAM3737 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3737 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52279] VGAM3737 gene, herein designated VGAM GENE, encodes a VGAM3737 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3737 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3737 precursor RNA is designated SEQ ID:84292, and is provided hereinbelow with reference to the sequence listing part.

[52280] VGAM3737 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52281] An enzyme complex designated DICER COMPLEX, dices the VGAM3737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3737 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3737 RNA is designated SEQ ID:84293,

and is provided hereinbelow with reference to the sequence listing part.

[52282] VGAM3737 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3737 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3737 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52283] VGAM3737 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3737 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3737 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3737 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3737 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52284] The complementary binding of VGAM3737 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3737 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3737 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3737 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52285] It is appreciated that VGAM3737 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3737 host target genes. The mRNA of each one of this plurality of VGAM3737 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3737 RNA, herein designated VGAM RNA, and which when bound by VGAM3737 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3737 host target proteins.

[52286] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3737 gene, herein designated VGAM GENE, on one or more VGAM3737 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52287] It is yet further appreciated that a function of VGAM3737 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3737 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3737 correlate with, and may be deduced from, the identity of the host target genes which VGAM3737 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52288] Nucleotide sequences of the VGAM3737 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3737 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3737 are further described hereinbelow with reference to Table 1.

[52289] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3737 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52290] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3738 (VGAM3738) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52291] VGAM3738 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3738 was detected is described hereinabove with reference to Figs. 2–8.

[52292] VGAM3738 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3738 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52293] VGAM3738 gene, herein designated VGAM GENE, encodes a VGAM3738 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3738 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3738 precu-

sor RNA is designated SEQ ID:84321, and is provided hereinbelow with reference to the sequence listing part.

[52294] VGAM3738 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52295] An enzyme complex designated DICER COMPLEX, dices the VGAM3738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3738 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3738 RNA is designated SEQ ID:84322, and is provided hereinbelow with reference to the se-

quence listing part.

[52296] VGAM3738 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3738 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3738 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52297] VGAM3738 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3738 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3738 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3738 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3738 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52298] The complementary binding of VGAM3738 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3738 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3738 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3738 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52299] It is appreciated that VGAM3738 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3738 host target genes. The mRNA of each one of this plurality of VGAM3738 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3738 RNA, herein designated VGAM RNA, and which when bound by VGAM3738 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3738 host target proteins.

[52300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3738 gene, herein designated VGAM GENE, on one or more VGAM3738 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52301] It is yet further appreciated that a function of VGAM3738

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3738 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3738 correlate with, and may be deduced from, the identity of the host target genes which VGAM3738 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52302] Nucleotide sequences of the VGAM3738 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3738 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3738 are further described hereinbelow with reference to Table 1.

[52303] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3738 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52304] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3739 (VGAM3739) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52305] VGAM3739 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3739 was detected is described hereinabove with reference to Figs. 2–8.

[52306] VGAM3739 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3739 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52307] VGAM3739 gene, herein designated VGAM GENE, encodes a VGAM3739 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3739 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3739 precursor RNA is designated SEQ ID:84598, and is provided

hereinbelow with reference to the sequence listing part.

[52308] VGAM3739 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52309] An enzyme complex designated DICER COMPLEX, dices the VGAM3739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3739 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3739 RNA is designated SEQ ID:84599, and is provided hereinbelow with reference to the sequence listing part.

[52310] VGAM3739 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3739 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3739 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52311] VGAM3739 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3739 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3739 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3739 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3739 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52312] The complementary binding of VGAM3739 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3739 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3739 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3739 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52313] It is appreciated that VGAM3739 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3739 host target genes. The mRNA of each one of this plurality of VGAM3739 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3739 RNA, herein designated VGAM RNA, and which when bound by VGAM3739 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3739 host target proteins.

[52314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3739 gene, herein designated VGAM GENE, on one or more VGAM3739 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52315] It is yet further appreciated that a function of VGAM3739 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3739 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3739 correlate with, and may be deduced from, the identity of the host target genes which VGAM3739 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52316] Nucleotide sequences of the VGAM3739 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3739 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3739 are further described hereinbelow with reference to Table 1.

[52317] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3739 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52318] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3740 (VGAM3740) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52319] VGAM3740 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3740 was detected is described hereinabove with reference to Figs. 2–8.

[52320] VGAM3740 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM3740 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52321] VGAM3740 gene, herein designated VGAM GENE, encodes a VGAM3740 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3740 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3740 precursor RNA is designated SEQ ID:84612, and is provided hereinbelow with reference to the sequence listing part.

[52322] VGAM3740 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52323] An enzyme complex designated DICER COMPLEX, dices the VGAM3740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3740 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3740 RNA is designated SEQ ID:84613, and is provided hereinbelow with reference to the sequence listing part.

[52324] VGAM3740 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3740 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3740 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52325] VGAM3740 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3740 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3740 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3740 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3740 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52326] The complementary binding of VGAM3740 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3740 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3740 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3740 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52327] It is appreciated that VGAM3740 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3740 host target genes. The mRNA of each one of this plurality of VGAM3740 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3740 RNA, herein designated VGAM

RNA, and which when bound by VGAM3740 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3740 host target proteins.

[52328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3740 gene, herein designated VGAM GENE, on one or more VGAM3740 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52329] It is yet further appreciated that a function of VGAM3740 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3740 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3740 correlate with, and may be deduced from, the identity of the host target genes which VGAM3740 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52330] Nucleotide sequences of the VGAM3740 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3740 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3740 are further described hereinbelow with reference to Table 1.

[52331] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3740 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52332] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3741 (VGAM3741) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52333] VGAM3741 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3741 was detected is described hereinabove with reference to Figs. 2-8.

[52334] VGAM3741 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM3741 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52335] VGAM3741 gene, herein designated VGAM GENE, encodes a VGAM3741 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3741 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3741 precursor RNA is designated SEQ ID:84639, and is provided hereinbelow with reference to the sequence listing part.

[52336] VGAM3741 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52337] An enzyme complex designated DICER COMPLEX, dices the VGAM3741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3741 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3741 RNA is designated SEQ ID:84640, and is provided hereinbelow with reference to the sequence listing part.

[52338] VGAM3741 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3741 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3741 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52339] VGAM3741 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3741 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3741 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3741 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3741 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52340] The complementary binding of VGAM3741 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3741 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3741 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3741 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52341] It is appreciated that VGAM3741 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3741 host target genes. The mRNA of each one of this plurality of VGAM3741 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3741 RNA, herein designated VGAM RNA, and which when bound by VGAM3741 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3741 host target proteins.

[52342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3741 gene, herein designated VGAM GENE, on one or more VGAM3741 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52343] It is yet further appreciated that a function of VGAM3741 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3741 include diagnosis, prevention and

treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM3741 correlate with, and may be deduced from, the identity of the host target genes which VGAM3741 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52344] Nucleotide sequences of the VGAM3741 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3741 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3741 are further described hereinbelow with reference to Table 1.

[52345] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3741 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52346] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3742 (VGAM3742) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52347] VGAM3742 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3742 was detected is described hereinabove with reference to Figs. 2–8.

[52348] VGAM3742 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3742 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52349] VGAM3742 gene, herein designated VGAM GENE, encodes a VGAM3742 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3742 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3742 precursor RNA is designated SEQ ID:84654, and is provided hereinbelow with reference to the sequence listing part.

[52350] VGAM3742 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3742 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52351] An enzyme complex designated DICER COMPLEX, dices the VGAM3742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3742 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3742 RNA is designated SEQ ID:84655, and is provided hereinbelow with reference to the sequence listing part.

[52352] VGAM3742 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3742 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3742 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52353] VGAM3742 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3742 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3742 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3742 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3742 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52354] The complementary binding of VGAM3742 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3742 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3742 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3742 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52355] It is appreciated that VGAM3742 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3742 host target genes. The mRNA of each one of this plurality of VGAM3742 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3742 RNA, herein designated VGAM RNA, and which when bound by VGAM3742 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3742 host target proteins.

[52356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3742 gene, herein designated VGAM GENE, on one or more VGAM3742 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52357] It is yet further appreciated that a function of VGAM3742 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3742 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Spe-

cific functions, and accordingly utilities, of VGAM3742 correlate with, and may be deduced from, the identity of the host target genes which VGAM3742 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52358] Nucleotide sequences of the VGAM3742 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3742 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3742 are further described hereinbelow with reference to Table 1.

[52359] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3742 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52360] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3743 (VGAM3743) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[52361] VGAM3743 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3743 was detected is described hereinabove with reference to Figs. 2–8.

[52362] VGAM3743 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3743 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52363] VGAM3743 gene, herein designated VGAM GENE, encodes a VGAM3743 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3743 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3743 precursor RNA is designated SEQ ID:84667, and is provided hereinbelow with reference to the sequence listing part.

[52364] VGAM3743 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3743 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52365] An enzyme complex designated DICER COMPLEX, dices the VGAM3743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3743 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3743 RNA is designated SEQ ID:84668, and is provided hereinbelow with reference to the sequence listing part.

[52366] VGAM3743 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3743 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3743 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52367] VGAM3743 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3743 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3743 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3743 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3743 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52368] The complementary binding of VGAM3743 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3743 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3743 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3743 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52369] It is appreciated that VGAM3743 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3743 host target genes. The mRNA of each one of this plurality of VGAM3743 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3743 RNA, herein designated VGAM RNA, and which when bound by VGAM3743 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3743 host target proteins.

[52370] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3743 gene, herein designated VGAM GENE, on one or more VGAM3743 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52371] It is yet further appreciated that a function of VGAM3743 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3743 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3743

correlate with, and may be deduced from, the identity of the host target genes which VGAM3743 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52372] Nucleotide sequences of the VGAM3743 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3743 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3743 are further described hereinbelow with reference to Table 1.

[52373] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3743 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52374] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3744 (VGAM3744) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[52375] VGAM3744 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3744 was detected is described hereinabove with reference to Figs. 2–8.

[52376] VGAM3744 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Okra enation virus. VGAM3744 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52377] VGAM3744 gene, herein designated VGAM GENE, encodes a VGAM3744 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3744 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3744 precursor RNA is designated SEQ ID:84746, and is provided hereinbelow with reference to the sequence listing part.

[52378] VGAM3744 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52379] An enzyme complex designated DICER COMPLEX, dices the VGAM3744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3744 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3744 RNA is designated SEQ ID:84747, and is provided hereinbelow with reference to the sequence listing part.

[52380] VGAM3744 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3744 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3744 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52381] VGAM3744 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3744 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3744 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3744 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3744 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52382] The complementary binding of VGAM3744 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3744 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3744 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3744 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52383] It is appreciated that VGAM3744 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3744 host target genes. The mRNA of each one of this plurality of VGAM3744 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3744 RNA, herein designated VGAM RNA, and which when bound by VGAM3744 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3744 host target proteins.

[52384] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3744 gene, herein designated VGAM GENE, on one or more VGAM3744 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52385] It is yet further appreciated that a function of VGAM3744 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3744 include diagnosis, prevention and treatment of viral infection by Okra enation virus. Specific functions, and accordingly utilities, of VGAM3744 correlate with, and may be deduced from, the identity of the

host target genes which VGAM3744 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52386] Nucleotide sequences of the VGAM3744 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3744 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3744 are further described hereinbelow with reference to Table 1.

[52387] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3744 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52388] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3745 (VGAM3745) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52389] VGAM3745 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3745 was detected is described hereinabove with reference to Figs. 2–8.

[52390] VGAM3745 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3745 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52391] VGAM3745 gene, herein designated VGAM GENE, encodes a VGAM3745 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3745 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3745 precursor RNA is designated SEQ ID:84759, and is provided hereinbelow with reference to the sequence listing part.

[52392] VGAM3745 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52393] An enzyme complex designated DICER COMPLEX, dices the VGAM3745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3745 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3745 RNA is designated SEQ ID:84760, and is provided hereinbelow with reference to the sequence listing part.

[52394] VGAM3745 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3745 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3745 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52395] VGAM3745 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3745 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3745 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3745 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3745 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52396] The complementary binding of VGAM3745 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3745 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3745 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3745 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52397] It is appreciated that VGAM3745 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3745 host target genes. The mRNA of each one of this plurality of VGAM3745 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3745 RNA, herein designated VGAM RNA, and which when bound by VGAM3745 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3745 host target proteins.

[52398] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3745 gene, herein designated VGAM GENE, on one or more VGAM3745 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52399] It is yet further appreciated that a function of VGAM3745 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3745 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3745 correlate with, and may be deduced from, the identity of the host target genes which

VGAM3745 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52400] Nucleotide sequences of the VGAM3745 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3745 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3745 are further described hereinbelow with reference to Table 1.

[52401] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3745 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52402] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3746 (VGAM3746) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52403] VGAM3746 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3746 was detected is described hereinabove with reference to Figs. 2–8.

[52404] VGAM3746 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat streak mosaic virus. VGAM3746 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52405] VGAM3746 gene, herein designated VGAM GENE, encodes a VGAM3746 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3746 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3746 precursor RNA is designated SEQ ID:84777, and is provided hereinbelow with reference to the sequence listing part.

[52406] VGAM3746 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52407] An enzyme complex designated DICER COMPLEX, dices the VGAM3746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3746 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3746 RNA is designated SEQ ID:84778, and is provided hereinbelow with reference to the sequence listing part.

[52408] VGAM3746 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3746 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3746 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52409] VGAM3746 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3746 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3746 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3746 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3746 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[52410] The complementary binding of VGAM3746 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3746 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3746 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3746 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52411] It is appreciated that VGAM3746 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3746 host target genes. The mRNA of each one of this plurality of VGAM3746 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3746 RNA, herein designated VGAM RNA, and which when bound by VGAM3746 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3746 host target proteins.

[52412] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3746 gene, herein designated VGAM GENE, on one or more VGAM3746 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52413] It is yet further appreciated that a function of VGAM3746 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3746 include diagnosis, prevention and treatment of viral infection by Wheat streak mosaic virus. Specific functions, and accordingly utilities, of VGAM3746 correlate with, and may be deduced from, the identity of the host target genes which VGAM3746 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[52414] Nucleotide sequences of the VGAM3746 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3746 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3746 are further described hereinbelow with reference to Table 1.

[52415] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3746 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52416] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3747 (VGAM3747) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52417] VGAM3747 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3747 was detected is described hereinabove with reference to Figs. 2–8.

[52418] VGAM3747 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai virus. VGAM3747 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52419] VGAM3747 gene, herein designated VGAM GENE, encodes a VGAM3747 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3747 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3747 precursor RNA is designated SEQ ID:84805, and is provided hereinbelow with reference to the sequence listing part.

[52420] VGAM3747 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52421] An enzyme complex designated DICER COMPLEX, dices the VGAM3747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3747 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3747 RNA is designated SEQ ID:84806, and is provided hereinbelow with reference to the sequence listing part.

[52422] VGAM3747 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3747 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3747 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52423] VGAM3747 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3747 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3747 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3747 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3747 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52424] The complementary binding of VGAM3747 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3747 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3747 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3747 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52425] It is appreciated that VGAM3747 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3747 host target genes. The mRNA of each one of this plurality of VGAM3747 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3747 RNA, herein designated VGAM RNA, and which when bound by VGAM3747 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3747 host target proteins.

[52426] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3747 gene, herein designated VGAM GENE, on one or more VGAM3747 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52427] It is yet further appreciated that a function of VGAM3747 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3747 include diagnosis, prevention and treatment of viral infection by Sendai virus. Specific functions, and accordingly utilities, of VGAM3747 correlate with, and may be deduced from, the identity of the host target genes which VGAM3747 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52428] Nucleotide sequences of the VGAM3747 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3747 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3747 are further described hereinbelow with reference to Table 1.

[52429] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3747 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52430] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3748 (VGAM3748) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52431] VGAM3748 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3748 was detected is described hereinabove with reference to Figs. 2-8.

[52432] VGAM3748 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D.

VGAM3748 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52433] VGAM3748 gene, herein designated VGAM GENE, encodes a VGAM3748 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3748 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3748 precursor RNA is designated SEQ ID:84825, and is provided hereinbelow with reference to the sequence listing part.

[52434] VGAM3748 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[52435] An enzyme complex designated DICER COMPLEX, dices the VGAM3748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3748 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3748 RNA is designated SEQ ID:84826, and is provided hereinbelow with reference to the sequence listing part.

[52436] VGAM3748 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3748 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3748 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52437] VGAM3748 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3748 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3748 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3748 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3748 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52438] The complementary binding of VGAM3748 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3748 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3748 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3748 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52439] It is appreciated that VGAM3748 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3748 host target genes. The mRNA of each one of this plurality of VGAM3748 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3748 RNA, herein designated VGAM RNA, and which when bound by VGAM3748 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3748 host target proteins.

[52440] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3748 gene, herein designated VGAM GENE, on one or more VGAM3748 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52441] It is yet further appreciated that a function of VGAM3748 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3748 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3748 correlate with, and may be deduced from, the identity of the host target genes which VGAM3748 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52442] Nucleotide sequences of the VGAM3748 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3748 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3748 are further described hereinbelow with reference to Table 1.

[52443] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3748 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52444] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3749 (VGAM3749) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52445] VGAM3749 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3749 was detected is described hereinabove with reference to Figs. 2-8.

[52446] VGAM3749 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Paramecium bursaria
Chlorella virus 1. VGAM3749 host target gene, herein
designated VGAM HOST TARGET GENE, is a human gene
contained in the human genome.

[52447] VGAM3749 gene, herein designated VGAM GENE, encodes
a VGAM3749 precursor RNA, herein designated VGAM
PRECURSOR RNA. Similar to other miRNA genes, and un-
like most ordinary genes, VGAM3749 precursor RNA,
herein designated VGAM PRECURSOR RNA, does not en-
code a protein. A nucleotide sequence identical or highly
similar to the nucleotide sequence of VGAM3749 precu-
sor RNA is designated SEQ ID:84834, and is provided
hereinbelow with reference to the sequence listing part.

[52448] VGAM3749 precursor RNA, herein designated VGAM PRE-
CURSOR RNA, folds onto itself, forming VGAM3749 folded
precursor RNA, herein designated VGAM FOLDED PRECUR-
SOR RNA, which has a two-dimensional hairpin structure.
As is well known in the art, this hairpin structure, is typi-
cal of RNA encoded by miRNA genes, and is due to the
fact that the nucleotide sequence of the first half of the
RNA encoded by a miRNA gene is an accurate or partial
inversed-reversed sequence of the nucleotide sequence of
the second half thereof.

[52449] An enzyme complex designated DICER COMPLEX, dices the VGAM3749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3749 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3749 RNA is designated SEQ ID:84835, and is provided hereinbelow with reference to the sequence listing part.

[52450] VGAM3749 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3749 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3749 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52451] VGAM3749 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3749 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3749 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3749 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3749 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52452] The complementary binding of VGAM3749 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3749 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3749 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3749 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52453] It is appreciated that VGAM3749 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3749 host target genes. The mRNA of each one of this plurality of VGAM3749 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3749 RNA, herein designated VGAM RNA, and which when bound by VGAM3749 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3749 host target proteins.

[52454] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3749 gene, herein designated VGAM GENE, on one or more VGAM3749 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52455] It is yet further appreciated that a function of VGAM3749 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3749 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3749 correlate with, and may be deduced from, the identity of the host target genes which VGAM3749 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52456] Nucleotide sequences of the VGAM3749 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3749 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3749 are further described hereinbelow with reference to Table 1.

[52457] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3749 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52458] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3750 (VGAM3750) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52459] VGAM3750 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3750 was detected is described hereinabove with reference to Figs. 2-8.

[52460] VGAM3750 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria

Chlorella virus 1. VGAM3750 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52461] VGAM3750 gene, herein designated VGAM GENE, encodes a VGAM3750 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3750 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3750 precursor RNA is designated SEQ ID:84842, and is provided hereinbelow with reference to the sequence listing part.

[52462] VGAM3750 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52463] An enzyme complex designated DICER COMPLEX, dices

the VGAM3750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3750 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3750 RNA is designated SEQ ID:84843, and is provided hereinbelow with reference to the sequence listing part.

[52464] VGAM3750 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3750 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3750 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52465] VGAM3750 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3750 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3750 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3750 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3750 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52466] The complementary binding of VGAM3750 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3750 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3750 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3750 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52467] It is appreciated that VGAM3750 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3750 host target genes. The mRNA of each one of this plurality of VGAM3750 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3750 RNA, herein designated VGAM RNA, and which when bound by VGAM3750 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3750 host target proteins.

[52468] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3750 gene, herein designated VGAM GENE, on one or more VGAM3750 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52469] It is yet further appreciated that a function of VGAM3750 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3750 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3750 correlate with, and may be deduced from, the identity of the host target genes which VGAM3750 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52470] Nucleotide sequences of the VGAM3750 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3750 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3750 are further described hereinbelow with reference to Table 1.

[52471] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3750 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52472] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3751 (VGAM3751) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52473] VGAM3751 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3751 was detected is described hereinabove with reference to Figs. 2-8.

[52474] VGAM3751 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM3751 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52475] VGAM3751 gene, herein designated VGAM GENE, encodes a VGAM3751 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3751 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3751 precursor RNA is designated SEQ ID:84845, and is provided hereinbelow with reference to the sequence listing part.

[52476] VGAM3751 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52477] An enzyme complex designated DICER COMPLEX, dices the VGAM3751 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3751 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3751 RNA is designated SEQ ID:84846, and is provided hereinbelow with reference to the sequence listing part.

[52478] VGAM3751 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3751 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3751 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52479] VGAM3751 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3751 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3751 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3751 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3751 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52480] The complementary binding of VGAM3751 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3751 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3751

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3751 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52481] It is appreciated that VGAM3751 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3751 host target genes. The mRNA of each one of this plurality of VGAM3751 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3751 RNA, herein designated VGAM RNA, and which when bound by VGAM3751 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3751 host target proteins.

[52482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3751 gene, herein designated VGAM GENE, on one or more VGAM3751 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52483] It is yet further appreciated that a function of VGAM3751 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3751 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM3751 correlate with, and may be deduced from, the identity of the host target genes which VGAM3751 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52484] Nucleotide sequences of the VGAM3751 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3751 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3751 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3751 are further described hereinbelow with reference to Table 1.

[52485] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3751 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52486] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3752 (VGAM3752) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52487] VGAM3752 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3752 was detected is described hereinabove with reference to Figs. 2-8.

[52488] VGAM3752 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3752 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[52489] VGAM3752 gene, herein designated VGAM GENE, encodes a VGAM3752 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3752 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3752 precursor RNA is designated SEQ ID:84865, and is provided hereinbelow with reference to the sequence listing part.

[52490] VGAM3752 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52491] An enzyme complex designated DICER COMPLEX, dices the VGAM3752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3752 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3752 RNA is designated SEQ ID:84866, and is provided hereinbelow with reference to the sequence listing part.

[52492] VGAM3752 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3752 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3752 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52493] VGAM3752 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3752 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3752 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3752 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3752 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52494] The complementary binding of VGAM3752 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3752 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3752 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3752 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52495] It is appreciated that VGAM3752 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3752 host target genes. The mRNA of each one of this plurality of VGAM3752 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3752 RNA, herein designated VGAM RNA, and which when bound by VGAM3752 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3752 host target proteins.

[52496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3752 gene, herein designated VGAM GENE, on one or more VGAM3752 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52497] It is yet further appreciated that a function of VGAM3752 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3752 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3752 correlate with, and may be deduced from, the identity of the host target genes which VGAM3752 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52498] Nucleotide sequences of the VGAM3752 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3752 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3752 are further

described hereinbelow with reference to Table 1.

[52499] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3752 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52500] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3753 (VGAM3753) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52501] VGAM3753 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3753 was detected is described hereinabove with reference to Figs. 2-8.

[52502] VGAM3753 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM3753 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52503] VGAM3753 gene, herein designated VGAM GENE, encodes a VGAM3753 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3753 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3753 precursor RNA is designated SEQ ID:84873, and is provided hereinbelow with reference to the sequence listing part.

[52504] VGAM3753 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52505] An enzyme complex designated DICER COMPLEX, dices the VGAM3753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3753 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3753 RNA is designated SEQ ID:84874, and is provided hereinbelow with reference to the sequence listing part.

[52506] VGAM3753 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3753 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3753 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52507] VGAM3753 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3753 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3753 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3753 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3753 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52508] The complementary binding of VGAM3753 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3753 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3753 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3753 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52509] It is appreciated that VGAM3753 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3753 host target genes. The mRNA of each one of this plurality of VGAM3753 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3753 RNA, herein designated VGAM RNA, and which when bound by VGAM3753 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3753 host target proteins.

[52510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3753 gene, herein designated VGAM GENE, on one or more VGAM3753 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52511] It is yet further appreciated that a function of VGAM3753 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3753 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3753 correlate with, and may be deduced from, the identity of the host target genes which VGAM3753 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52512] Nucleotide sequences of the VGAM3753 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3753 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3753 are further described hereinbelow with reference to Table 1.

[52513] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3753 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52514] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3754 (VGAM3754) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52515] VGAM3754 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3754 was detected is described hereinabove with reference to Figs. 2-8.

[52516] VGAM3754 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3754 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52517] VGAM3754 gene, herein designated VGAM GENE, encodes

a VGAM3754 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3754 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3754 precursor RNA is designated SEQ ID:84881, and is provided hereinbelow with reference to the sequence listing part.

[52518] VGAM3754 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52519] An enzyme complex designated DICER COMPLEX, dices the VGAM3754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3754 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3754 RNA is designated SEQ ID:84882, and is provided hereinbelow with reference to the sequence listing part.

[52520] VGAM3754 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3754 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3754 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52521] VGAM3754 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3754 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3754 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3754 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3754 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52522] The complementary binding of VGAM3754 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3754 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3754 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3754 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[52523] It is appreciated that VGAM3754 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3754 host target genes. The mRNA of each one of this plurality of VGAM3754 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3754 RNA, herein designated VGAM RNA, and which when bound by VGAM3754 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3754 host target proteins.

[52524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3754 gene, herein designated VGAM GENE, on one or more VGAM3754 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52525] It is yet further appreciated that a function of VGAM3754 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3754 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3754 correlate with, and may be deduced from, the identity of the host target genes which VGAM3754 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52526] Nucleotide sequences of the VGAM3754 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3754 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3754 are further described hereinbelow with reference to Table 1.

[52527] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3754 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52528] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3755 (VGAM3755) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52529] VGAM3755 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3755 was detected is described hereinabove with reference to Figs. 2-8.

[52530] VGAM3755 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3755 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52531] VGAM3755 gene, herein designated VGAM GENE, encodes a VGAM3755 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3755 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3755 precursor RNA is designated SEQ ID:84900, and is provided hereinbelow with reference to the sequence listing part.

[52532] VGAM3755 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52533] An enzyme complex designated DICER COMPLEX, dices the VGAM3755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3755 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3755 RNA is designated SEQ ID:84901, and is provided hereinbelow with reference to the sequence listing part.

[52534] VGAM3755 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3755 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3755 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52535] VGAM3755 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3755 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3755 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3755 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3755 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52536] The complementary binding of VGAM3755 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3755 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3755 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3755 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52537] It is appreciated that VGAM3755 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3755 host target genes. The mRNA of each one of this plurality of VGAM3755 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3755 RNA, herein designated VGAM RNA, and which when bound by VGAM3755 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3755 host target proteins.

[52538] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3755 gene, herein designated VGAM GENE, on one or more VGAM3755 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52539] It is yet further appreciated that a function of VGAM3755 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3755 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3755 correlate with, and may be deduced from, the identity of the host target genes which VGAM3755 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52540] Nucleotide sequences of the VGAM3755 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3755 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3755 are further described hereinbelow with reference to Table 1.

[52541] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3755 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52542] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3756 (VGAM3756) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52543] VGAM3756 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3756 was detected is described hereinabove with reference to Figs. 2-8.

[52544] VGAM3756 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Theilovirus. VGAM3756 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52545] VGAM3756 gene, herein designated VGAM GENE, encodes a VGAM3756 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3756 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3756 precursor RNA is designated SEQ ID:84917, and is provided hereinbelow with reference to the sequence listing part.

[52546] VGAM3756 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52547] An enzyme complex designated DICER COMPLEX, dices the VGAM3756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3756 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3756 RNA is designated SEQ ID:84918, and is provided hereinbelow with reference to the sequence listing part.

[52548] VGAM3756 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3756 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3756 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52549] VGAM3756 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3756 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3756 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3756 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3756 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52550] The complementary binding of VGAM3756 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3756 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3756 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3756 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52551] It is appreciated that VGAM3756 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3756 host target genes. The mRNA of each one of this plurality of VGAM3756 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3756 RNA, herein designated VGAM RNA, and which when bound by VGAM3756 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3756 host target proteins.

[52552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3756 gene, herein designated VGAM GENE, on one or more VGAM3756 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[52553] It is yet further appreciated that a function of VGAM3756 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3756 include diagnosis, prevention and treatment of viral infection by Theilovirus. Specific functions, and accordingly utilities, of VGAM3756 correlate with, and may be deduced from, the identity of the host target genes which VGAM3756 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52554] Nucleotide sequences of the VGAM3756 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3756 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3756 are further described hereinbelow with reference to Table 1.

[52555] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3756 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52556] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3757 (VGAM3757) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52557] VGAM3757 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3757 was detected is described hereinabove with reference to Figs. 2-8.

[52558] VGAM3757 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM3757 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52559] VGAM3757 gene, herein designated VGAM GENE, encodes a VGAM3757 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3757 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3757 precursor RNA is designated SEQ ID:84920, and is provided hereinbelow with reference to the sequence listing part.

[52560] VGAM3757 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52561] An enzyme complex designated DICER COMPLEX, dices the VGAM3757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3757 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3757 RNA is designated SEQ ID:84921, and is provided hereinbelow with reference to the sequence listing part.

[52562] VGAM3757 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3757 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3757 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52563] VGAM3757 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3757 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3757 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3757 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3757 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52564] The complementary binding of VGAM3757 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3757 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3757 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3757 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52565] It is appreciated that VGAM3757 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3757 host target genes. The mRNA of

each one of this plurality of VGAM3757 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3757 RNA, herein designated VGAM RNA, and which when bound by VGAM3757 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3757 host target proteins.

[52566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3757 gene, herein designated VGAM GENE, on one or more VGAM3757 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[52567] It is yet further appreciated that a function of VGAM3757 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3757 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM3757 correlate with, and may be deduced from, the identity of the host target genes which VGAM3757 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52568] Nucleotide sequences of the VGAM3757 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3757 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3757 are further described hereinbelow with reference to Table 1.

[52569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3757 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[52570] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3758 (VGAM3758) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52571] VGAM3758 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3758 was detected is described hereinabove with reference to Figs. 2–8.

[52572] VGAM3758 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3758 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52573] VGAM3758 gene, herein designated VGAM GENE, encodes a VGAM3758 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3758 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3758 precursor RNA is designated SEQ ID:84924, and is provided hereinbelow with reference to the sequence listing part.

[52574] VGAM3758 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52575] An enzyme complex designated DICER COMPLEX, dices the VGAM3758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3758 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3758 RNA is designated SEQ ID:84925,

and is provided hereinbelow with reference to the sequence listing part.

[52576] VGAM3758 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3758 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3758 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52577] VGAM3758 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3758 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3758 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3758 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3758 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52578] The complementary binding of VGAM3758 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3758 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3758 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3758 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52579] It is appreciated that VGAM3758 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3758 host target genes. The mRNA of each one of this plurality of VGAM3758 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3758 RNA, herein designated VGAM RNA, and which when bound by VGAM3758 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3758 host target proteins.

[52580] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3758 gene, herein designated VGAM GENE, on one or more VGAM3758 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52581] It is yet further appreciated that a function of VGAM3758 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3758 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3758 correlate with, and may be deduced from, the identity of the host target genes which VGAM3758 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52582] Nucleotide sequences of the VGAM3758 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3758 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3758 are further described hereinbelow with reference to Table 1.

[52583] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3758 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52584] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3759 (VGAM3759) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52585] VGAM3759 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3759 was detected is described hereinabove with reference to Figs. 2–8.

[52586] VGAM3759 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM3759 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52587] VGAM3759 gene, herein designated VGAM GENE, encodes a VGAM3759 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3759 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3759 precu-

sor RNA is designated SEQ ID:84939, and is provided hereinbelow with reference to the sequence listing part.

[52588] VGAM3759 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52589] An enzyme complex designated DICER COMPLEX, dices the VGAM3759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3759 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3759 RNA is designated SEQ ID:84940, and is provided hereinbelow with reference to the se-

quence listing part.

[52590] VGAM3759 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3759 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3759 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52591] VGAM3759 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3759 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3759 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3759 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3759 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52592] The complementary binding of VGAM3759 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3759 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3759 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3759 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52593] It is appreciated that VGAM3759 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3759 host target genes. The mRNA of each one of this plurality of VGAM3759 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3759 RNA, herein designated VGAM RNA, and which when bound by VGAM3759 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3759 host target proteins.

[52594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3759 gene, herein designated VGAM GENE, on one or more VGAM3759 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52595] It is yet further appreciated that a function of VGAM3759

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3759 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3759 correlate with, and may be deduced from, the identity of the host target genes which VGAM3759 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52596] Nucleotide sequences of the VGAM3759 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3759 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3759 are further described hereinbelow with reference to Table 1.

[52597] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3759 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52598] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3760 (VGAM3760) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52599] VGAM3760 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3760 was detected is described hereinabove with reference to Figs. 2–8.

[52600] VGAM3760 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3760 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52601] VGAM3760 gene, herein designated VGAM GENE, encodes a VGAM3760 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3760 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3760 precursor RNA is designated SEQ ID:84943, and is provided

hereinbelow with reference to the sequence listing part.

[52602] VGAM3760 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52603] An enzyme complex designated DICER COMPLEX, dices the VGAM3760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3760 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3760 RNA is designated SEQ ID:84944, and is provided hereinbelow with reference to the sequence listing part.

[52604] VGAM3760 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3760 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3760 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52605] VGAM3760 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3760 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3760 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3760 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3760 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52606] The complementary binding of VGAM3760 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3760 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3760 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3760 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52607] It is appreciated that VGAM3760 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3760 host target genes. The mRNA of each one of this plurality of VGAM3760 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3760 RNA, herein designated VGAM RNA, and which when bound by VGAM3760 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3760 host target proteins.

[52608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3760 gene, herein designated VGAM GENE, on one or more VGAM3760 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52609] It is yet further appreciated that a function of VGAM3760 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3760 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3760 correlate with, and may be deduced from, the identity of the host target genes which VGAM3760 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52610] Nucleotide sequences of the VGAM3760 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3760 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3760 are further described hereinbelow with reference to Table 1.

[52611] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3760 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52612] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3761 (VGAM3761) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52613] VGAM3761 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3761 was detected is described hereinabove with reference to Figs. 2–8.

[52614] VGAM3761 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3761 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52615] VGAM3761 gene, herein designated VGAM GENE, encodes a VGAM3761 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3761 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3761 precursor RNA is designated SEQ ID:84998, and is provided hereinbelow with reference to the sequence listing part.

[52616] VGAM3761 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52617] An enzyme complex designated DICER COMPLEX, dices the VGAM3761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3761 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3761 RNA is designated SEQ ID:84999, and is provided hereinbelow with reference to the sequence listing part.

[52618] VGAM3761 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3761 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3761 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52619] VGAM3761 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3761 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3761 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3761 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3761 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52620] The complementary binding of VGAM3761 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3761 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3761 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3761 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52621] It is appreciated that VGAM3761 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3761 host target genes. The mRNA of each one of this plurality of VGAM3761 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3761 RNA, herein designated VGAM

RNA, and which when bound by VGAM3761 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3761 host target proteins.

[52622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3761 gene, herein designated VGAM GENE, on one or more VGAM3761 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52623] It is yet further appreciated that a function of VGAM3761 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3761 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3761 correlate with, and may be deduced from, the identity of the host target genes which VGAM3761 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52624] Nucleotide sequences of the VGAM3761 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3761 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3761 are further described hereinbelow with reference to Table 1.

[52625] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3761 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52626] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3762 (VGAM3762) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52627] VGAM3762 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3762 was detected is described hereinabove with reference to Figs. 2–8.

[52628] VGAM3762 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3762 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52629] VGAM3762 gene, herein designated VGAM GENE, encodes a VGAM3762 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3762 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3762 precursor RNA is designated SEQ ID:85008, and is provided hereinbelow with reference to the sequence listing part.

[52630] VGAM3762 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52631] An enzyme complex designated DICER COMPLEX, dices the VGAM3762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3762 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3762 RNA is designated SEQ ID:85009, and is provided hereinbelow with reference to the sequence listing part.

[52632] VGAM3762 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3762 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3762 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52633] VGAM3762 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3762 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3762 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3762 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3762 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52634] The complementary binding of VGAM3762 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3762 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3762 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3762 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52635] It is appreciated that VGAM3762 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3762 host target genes. The mRNA of each one of this plurality of VGAM3762 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3762 RNA, herein designated VGAM RNA, and which when bound by VGAM3762 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3762 host target proteins.

[52636] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3762 gene, herein designated VGAM GENE, on one or more VGAM3762 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52637] It is yet further appreciated that a function of VGAM3762 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3762 include diagnosis, prevention and

treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3762 correlate with, and may be deduced from, the identity of the host target genes which VGAM3762 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52638] Nucleotide sequences of the VGAM3762 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3762 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3762 are further described hereinbelow with reference to Table 1.

[52639] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3762 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52640] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3763 (VGAM3763) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52641] VGAM3763 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3763 was detected is described hereinabove with reference to Figs. 2–8.

[52642] VGAM3763 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3763 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52643] VGAM3763 gene, herein designated VGAM GENE, encodes a VGAM3763 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3763 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3763 precursor RNA is designated SEQ ID:85055, and is provided hereinbelow with reference to the sequence listing part.

[52644] VGAM3763 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3763 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52645] An enzyme complex designated DICER COMPLEX, dices the VGAM3763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3763 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3763 RNA is designated SEQ ID:85056, and is provided hereinbelow with reference to the sequence listing part.

[52646] VGAM3763 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3763 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3763 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52647] VGAM3763 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3763 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3763 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3763 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3763 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52648] The complementary binding of VGAM3763 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3763 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3763 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3763 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52649] It is appreciated that VGAM3763 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3763 host target genes. The mRNA of each one of this plurality of VGAM3763 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3763 RNA, herein designated VGAM RNA, and which when bound by VGAM3763 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3763 host target proteins.

[52650] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3763 gene, herein designated VGAM GENE, on one or more VGAM3763 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52651] It is yet further appreciated that a function of VGAM3763 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3763 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM3763 correlate with, and may be deduced from, the identity of the host target genes which VGAM3763 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52652] Nucleotide sequences of the VGAM3763 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3763 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3763 are further described hereinbelow with reference to Table 1.

[52653] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3763 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52654] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3764 (VGAM3764) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[52655] VGAM3764 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3764 was detected is described hereinabove with reference to Figs. 2–8.

[52656] VGAM3764 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 1 strain Washington/1964. VGAM3764 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52657] VGAM3764 gene, herein designated VGAM GENE, encodes a VGAM3764 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3764 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3764 precursor RNA is designated SEQ ID:85065, and is provided hereinbelow with reference to the sequence listing part.

[52658] VGAM3764 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3764 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52659] An enzyme complex designated DICER COMPLEX, dices the VGAM3764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3764 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3764 RNA is designated SEQ ID:85066, and is provided hereinbelow with reference to the sequence listing part.

[52660] VGAM3764 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3764 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3764 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52661] VGAM3764 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3764 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3764 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3764 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3764 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52662] The complementary binding of VGAM3764 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3764 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3764 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3764 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52663] It is appreciated that VGAM3764 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3764 host target genes. The mRNA of each one of this plurality of VGAM3764 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3764 RNA, herein designated VGAM RNA, and which when bound by VGAM3764 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3764 host target proteins.

[52664] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3764 gene, herein designated VGAM GENE, on one or more VGAM3764 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52665] It is yet further appreciated that a function of VGAM3764 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3764 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 1 strain Washington/1964. Specific functions, and accord-

ingly utilities, of VGAM3764 correlate with, and may be deduced from, the identity of the host target genes which VGAM3764 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52666] Nucleotide sequences of the VGAM3764 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3764 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3764 are further described hereinbelow with reference to Table 1.

[52667] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3764 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52668] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3765 (VGAM3765) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[52669] VGAM3765 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3765 was detected is described hereinabove with reference to Figs. 2–8.

[52670] VGAM3765 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3765 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52671] VGAM3765 gene, herein designated VGAM GENE, encodes a VGAM3765 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3765 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3765 precursor RNA is designated SEQ ID:85070, and is provided hereinbelow with reference to the sequence listing part.

[52672] VGAM3765 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52673] An enzyme complex designated DICER COMPLEX, dices the VGAM3765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3765 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3765 RNA is designated SEQ ID:85071, and is provided hereinbelow with reference to the sequence listing part.

[52674] VGAM3765 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3765 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3765 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52675] VGAM3765 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3765 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3765 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3765 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3765 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52676] The complementary binding of VGAM3765 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3765 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3765 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3765 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52677] It is appreciated that VGAM3765 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3765 host target genes. The mRNA of each one of this plurality of VGAM3765 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3765 RNA, herein designated VGAM RNA, and which when bound by VGAM3765 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3765 host target proteins.

[52678] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3765 gene, herein designated VGAM GENE, on one or more VGAM3765 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52679] It is yet further appreciated that a function of VGAM3765 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3765 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3765 correlate with, and may be deduced

from, the identity of the host target genes which VGAM3765 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52680] Nucleotide sequences of the VGAM3765 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3765 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3765 are further described hereinbelow with reference to Table 1.

[52681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3765 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52682] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3766 (VGAM3766) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52683] VGAM3766 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3766 was detected is described hereinabove with reference to Figs. 2–8.

[52684] VGAM3766 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber mosaic virus. VGAM3766 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52685] VGAM3766 gene, herein designated VGAM GENE, encodes a VGAM3766 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3766 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3766 precursor RNA is designated SEQ ID:85085, and is provided hereinbelow with reference to the sequence listing part.

[52686] VGAM3766 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52687] An enzyme complex designated DICER COMPLEX, dices the VGAM3766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3766 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3766 RNA is designated SEQ ID:85086, and is provided hereinbelow with reference to the sequence listing part.

[52688] VGAM3766 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3766 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3766 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52689] VGAM3766 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3766 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3766 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3766 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3766 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52690] The complementary binding of VGAM3766 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3766 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3766 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3766 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52691] It is appreciated that VGAM3766 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3766 host target genes. The mRNA of each one of this plurality of VGAM3766 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3766 RNA, herein designated VGAM RNA, and which when bound by VGAM3766 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3766 host target proteins.

[52692] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3766 gene, herein designated VGAM GENE, on one or more VGAM3766 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52693] It is yet further appreciated that a function of VGAM3766 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3766 include diagnosis, prevention and treatment of viral infection by Cucumber mosaic virus. Specific functions, and accordingly utilities, of VGAM3766 correlate with, and may be deduced from, the identity of the host target genes which VGAM3766 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[52694] Nucleotide sequences of the VGAM3766 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3766 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3766 are further described hereinbelow with reference to Table 1.

[52695] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3766 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52696] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3767 (VGAM3767) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52697] VGAM3767 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3767 was detected is described hereinabove with reference to Figs. 2–8.

[52698] VGAM3767 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper ringspot virus. VGAM3767 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52699] VGAM3767 gene, herein designated VGAM GENE, encodes a VGAM3767 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3767 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3767 precursor RNA is designated SEQ ID:85089, and is provided hereinbelow with reference to the sequence listing part.

[52700] VGAM3767 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52701] An enzyme complex designated DICER COMPLEX, dices the VGAM3767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3767 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3767 RNA is designated SEQ ID:85090, and is provided hereinbelow with reference to the sequence listing part.

[52702] VGAM3767 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3767 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3767 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52703] VGAM3767 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3767 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3767 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3767 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3767 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[52704] The complementary binding of VGAM3767 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3767 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3767 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3767 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52705] It is appreciated that VGAM3767 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3767 host target genes. The mRNA of each one of this plurality of VGAM3767 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3767 RNA, herein designated VGAM RNA, and which when bound by VGAM3767 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3767 host target proteins.

[52706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3767 gene, herein designated VGAM GENE, on one or more VGAM3767 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52707] It is yet further appreciated that a function of VGAM3767 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3767 include diagnosis, prevention and treatment of viral infection by Pepper ringspot virus. Specific functions, and accordingly utilities, of VGAM3767 correlate with, and may be deduced from, the identity of the host target genes which VGAM3767 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[52708] Nucleotide sequences of the VGAM3767 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3767 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3767 are further described hereinbelow with reference to Table 1.

[52709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3767 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52710] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3768 (VGAM3768) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52711] VGAM3768 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3768 was detected is described hereinabove with reference to Figs. 2–8.

[52712] VGAM3768 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3768 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52713] VGAM3768 gene, herein designated VGAM GENE, encodes a VGAM3768 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3768 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3768 precursor RNA is designated SEQ ID:85094, and is provided hereinbelow with reference to the sequence listing part.

[52714] VGAM3768 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52715] An enzyme complex designated DICER COMPLEX, dices the VGAM3768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3768 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3768 RNA is designated SEQ ID:85095, and is provided hereinbelow with reference to the sequence listing part.

[52716] VGAM3768 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3768 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3768 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[52717] VGAM3768 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3768 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3768 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3768 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3768 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52718] The complementary binding of VGAM3768 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3768 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3768 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3768 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52719] It is appreciated that VGAM3768 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3768 host target genes. The mRNA of each one of this plurality of VGAM3768 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3768 RNA, herein designated VGAM RNA, and which when bound by VGAM3768 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3768 host target proteins.

[52720] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3768 gene, herein designated VGAM GENE, on one

or more VGAM3768 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52721] It is yet further appreciated that a function of VGAM3768 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3768 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3768 correlate with, and may be deduced from, the identity of the host target genes which VGAM3768 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52722] Nucleotide sequences of the VGAM3768 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3768 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3768 are further described hereinbelow with reference to Table 1.

[52723] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3768 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52724] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3769 (VGAM3769) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52725] VGAM3769 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3769 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[52726] VGAM3769 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice black streaked dwarf virus. VGAM3769 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52727] VGAM3769 gene, herein designated VGAM GENE, encodes a VGAM3769 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3769 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3769 precursor RNA is designated SEQ ID:85097, and is provided hereinbelow with reference to the sequence listing part.

[52728] VGAM3769 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52729] An enzyme complex designated DICER COMPLEX, dices the VGAM3769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3769 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3769 RNA is designated SEQ ID:85098, and is provided hereinbelow with reference to the sequence listing part.

[52730] VGAM3769 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3769 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3769 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52731] VGAM3769 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3769 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3769 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3769 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3769 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52732] The complementary binding of VGAM3769 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3769 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3769 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3769 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52733] It is appreciated that VGAM3769 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3769 host target genes. The mRNA of each one of this plurality of VGAM3769 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3769 RNA, herein designated VGAM RNA, and which when bound by VGAM3769 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3769 host target proteins.

[52734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3769 gene, herein designated VGAM GENE, on one or more VGAM3769 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52735] It is yet further appreciated that a function of VGAM3769 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3769 include diagnosis, prevention and treatment of viral infection by Rice black streaked dwarf virus. Specific functions, and accordingly utilities, of VGAM3769 correlate with, and may be deduced from, the identity of the host target genes which VGAM3769 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52736] Nucleotide sequences of the VGAM3769 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3769 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3769 are further described hereinbelow with reference to Table 1.

[52737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3769 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52738] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3770 (VGAM3770) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52739] VGAM3770 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3770 was detected is described hereinabove with reference to Figs. 2-8.

[52740] VGAM3770 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3770 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52741] VGAM3770 gene, herein designated VGAM GENE, encodes a VGAM3770 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3770 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3770 precursor RNA is designated SEQ ID:85125, and is provided hereinbelow with reference to the sequence listing part.

[52742] VGAM3770 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[52743] An enzyme complex designated DICER COMPLEX, dices the VGAM3770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3770 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3770 RNA is designated SEQ ID:85126, and is provided hereinbelow with reference to the sequence listing part.

[52744] VGAM3770 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3770 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3770 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52745] VGAM3770 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3770 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3770 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3770 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3770 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52746] The complementary binding of VGAM3770 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3770 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3770 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3770 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52747] It is appreciated that VGAM3770 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3770 host target genes. The mRNA of each one of this plurality of VGAM3770 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3770 RNA, herein designated VGAM RNA, and which when bound by VGAM3770 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3770 host target proteins.

[52748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3770 gene, herein designated VGAM GENE, on one or more VGAM3770 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52749] It is yet further appreciated that a function of VGAM3770 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3770 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3770 correlate with, and may be deduced from, the identity of the host target genes which VGAM3770 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52750] Nucleotide sequences of the VGAM3770 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3770 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3770 are further described hereinbelow with reference to Table 1.

[52751] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3770 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52752] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3771 (VGAM3771) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52753] VGAM3771 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3771 was detected is described hereinabove with reference to Figs. 2-8.

[52754] VGAM3771 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3771 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52755] VGAM3771 gene, herein designated VGAM GENE, encodes a VGAM3771 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3771 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3771 precursor RNA is designated SEQ ID:85133, and is provided hereinbelow with reference to the sequence listing part.

[52756] VGAM3771 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52757] An enzyme complex designated DICER COMPLEX, dices the VGAM3771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3771 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3771 RNA is designated SEQ ID:85134, and is provided hereinbelow with reference to the sequence listing part.

[52758] VGAM3771 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3771 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3771 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52759] VGAM3771 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3771 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3771 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3771 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3771 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52760] The complementary binding of VGAM3771 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3771 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3771 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3771 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52761] It is appreciated that VGAM3771 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3771 host target genes. The mRNA of each one of this plurality of VGAM3771 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3771 RNA, herein designated VGAM RNA, and which when bound by VGAM3771 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3771 host target proteins.

[52762] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3771 gene, herein designated VGAM GENE, on one or more VGAM3771 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52763] It is yet further appreciated that a function of VGAM3771 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3771 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3771 correlate with, and may be deduced from, the identity of the host target genes which VGAM3771 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52764] Nucleotide sequences of the VGAM3771 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3771 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3771 are further described hereinbelow with reference to Table 1.

[52765] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3771 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52766] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3772 (VGAM3772) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52767] VGAM3772 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3772 was detected is described hereinabove with reference to Figs. 2-8.

[52768] VGAM3772 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1.

VGAM3772 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52769] VGAM3772 gene, herein designated VGAM GENE, encodes a VGAM3772 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3772 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3772 precursor RNA is designated SEQ ID:85138, and is provided hereinbelow with reference to the sequence listing part.

[52770] VGAM3772 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52771] An enzyme complex designated DICER COMPLEX, dices

the VGAM3772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3772 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3772 RNA is designated SEQ ID:85139, and is provided hereinbelow with reference to the sequence listing part.

[52772] VGAM3772 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3772 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3772 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52773] VGAM3772 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3772 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3772 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3772 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3772 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52774] The complementary binding of VGAM3772 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3772 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3772 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3772 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52775] It is appreciated that VGAM3772 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3772 host target genes. The mRNA of each one of this plurality of VGAM3772 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3772 RNA, herein designated VGAM RNA, and which when bound by VGAM3772 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3772 host target proteins.

[52776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3772 gene, herein designated VGAM GENE, on one or more VGAM3772 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52777] It is yet further appreciated that a function of VGAM3772 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3772 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3772 correlate with, and may be deduced from, the identity of the host target genes which VGAM3772 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52778] Nucleotide sequences of the VGAM3772 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3772 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3772 are further described hereinbelow with reference to Table 1.

[52779] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3772 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52780] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3773 (VGAM3773) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52781] VGAM3773 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3773 was detected is described hereinabove with reference to Figs. 2-8.

[52782] VGAM3773 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3773 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52783] VGAM3773 gene, herein designated VGAM GENE, encodes a VGAM3773 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3773 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3773 precursor RNA is designated SEQ ID:85280, and is provided hereinbelow with reference to the sequence listing part.

[52784] VGAM3773 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52785] An enzyme complex designated DICER COMPLEX, dices the VGAM3773 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3773 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3773 RNA is designated SEQ ID:85281, and is provided hereinbelow with reference to the sequence listing part.

[52786] VGAM3773 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3773 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3773 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52787] VGAM3773 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3773 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3773 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3773 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3773 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52788] The complementary binding of VGAM3773 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3773 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3773

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3773 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52789] It is appreciated that VGAM3773 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3773 host target genes. The mRNA of each one of this plurality of VGAM3773 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3773 RNA, herein designated VGAM RNA, and which when bound by VGAM3773 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3773 host target proteins.

[52790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3773 gene, herein designated VGAM GENE, on one or more VGAM3773 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52791] It is yet further appreciated that a function of VGAM3773 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3773 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3773 correlate with, and may be deduced from, the identity of the host target genes which VGAM3773 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52792] Nucleotide sequences of the VGAM3773 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3773 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3773 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3773 are further described hereinbelow with reference to Table 1.

[52793] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3773 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52794] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3774 (VGAM3774) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52795] VGAM3774 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3774 was detected is described hereinabove with reference to Figs. 2-8.

[52796] VGAM3774 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3774 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene

contained in the human genome.

[52797] VGAM3774 gene, herein designated VGAM GENE, encodes a VGAM3774 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3774 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3774 precursor RNA is designated SEQ ID:85319, and is provided hereinbelow with reference to the sequence listing part.

[52798] VGAM3774 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52799] An enzyme complex designated DICER COMPLEX, dices the VGAM3774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3774 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3774 RNA is designated SEQ ID:85320, and is provided hereinbelow with reference to the sequence listing part.

[52800] VGAM3774 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3774 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3774 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52801] VGAM3774 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3774 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3774 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3774 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3774 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52802] The complementary binding of VGAM3774 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3774 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3774 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3774 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52803] It is appreciated that VGAM3774 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3774 host target genes. The mRNA of each one of this plurality of VGAM3774 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3774 RNA, herein designated VGAM RNA, and which when bound by VGAM3774 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3774 host target proteins.

[52804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3774 gene, herein designated VGAM GENE, on one or more VGAM3774 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52805] It is yet further appreciated that a function of VGAM3774 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3774 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3774 correlate with, and may be deduced from, the identity of the host target genes which VGAM3774 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52806] Nucleotide sequences of the VGAM3774 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3774 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3774 are further

described hereinbelow with reference to Table 1.

[52807] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3774 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52808] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3775 (VGAM3775) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52809] VGAM3775 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3775 was detected is described hereinabove with reference to Figs. 2-8.

[52810] VGAM3775 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3775 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52811] VGAM3775 gene, herein designated VGAM GENE, encodes a VGAM3775 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3775 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3775 precursor RNA is designated SEQ ID:85327, and is provided hereinbelow with reference to the sequence listing part.

[52812] VGAM3775 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52813] An enzyme complex designated DICER COMPLEX, dices the VGAM3775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3775 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3775 RNA is designated SEQ ID:85328, and is provided hereinbelow with reference to the sequence listing part.

[52814] VGAM3775 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3775 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3775 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52815] VGAM3775 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3775 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3775 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3775 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3775 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52816] The complementary binding of VGAM3775 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3775 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3775 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3775 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52817] It is appreciated that VGAM3775 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3775 host target genes. The mRNA of each one of this plurality of VGAM3775 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3775 RNA, herein designated VGAM RNA, and which when bound by VGAM3775 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3775 host target proteins.

[52818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3775 gene, herein designated VGAM GENE, on one or more VGAM3775 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52819] It is yet further appreciated that a function of VGAM3775 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3775 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3775 correlate with, and may be deduced from, the identity of the host target genes which VGAM3775 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52820] Nucleotide sequences of the VGAM3775 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3775 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3775 are further described hereinbelow with reference to Table 1.

[52821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3775 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52822] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3776 (VGAM3776) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52823] VGAM3776 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3776 was detected is described hereinabove with reference to Figs. 2-8.

[52824] VGAM3776 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus F. VGAM3776 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52825] VGAM3776 gene, herein designated VGAM GENE, encodes

a VGAM3776 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3776 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3776 precursor RNA is designated SEQ ID:85335, and is provided hereinbelow with reference to the sequence listing part.

[52826] VGAM3776 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52827] An enzyme complex designated DICER COMPLEX, dices the VGAM3776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3776 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3776 RNA is designated SEQ ID:85336, and is provided hereinbelow with reference to the sequence listing part.

[52828] VGAM3776 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3776 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3776 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52829] VGAM3776 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3776 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3776 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3776 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3776 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52830] The complementary binding of VGAM3776 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3776 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3776 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3776 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[52831] It is appreciated that VGAM3776 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3776 host target genes. The mRNA of each one of this plurality of VGAM3776 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3776 RNA, herein designated VGAM RNA, and which when bound by VGAM3776 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3776 host target proteins.

[52832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3776 gene, herein designated VGAM GENE, on one or more VGAM3776 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52833] It is yet further appreciated that a function of VGAM3776 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3776 include diagnosis, prevention and treatment of viral infection by Human adenovirus F. Specific functions, and accordingly utilities, of VGAM3776 correlate with, and may be deduced from, the identity of the host target genes which VGAM3776 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52834] Nucleotide sequences of the VGAM3776 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3776 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3776 are further described hereinbelow with reference to Table 1.

[52835] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3776 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52836] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3777 (VGAM3777) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52837] VGAM3777 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3777 was detected is described hereinabove with reference to Figs. 2-8.

[52838] VGAM3777 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 3. VGAM3777 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52839] VGAM3777 gene, herein designated VGAM GENE, encodes a VGAM3777 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3777 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3777 precursor RNA is designated SEQ ID:85340, and is provided hereinbelow with reference to the sequence listing part.

[52840] VGAM3777 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52841] An enzyme complex designated DICER COMPLEX, dices the VGAM3777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3777 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3777 RNA is designated SEQ ID:85341, and is provided hereinbelow with reference to the sequence listing part.

[52842] VGAM3777 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3777 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3777 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52843] VGAM3777 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3777 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3777 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3777 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3777 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52844] The complementary binding of VGAM3777 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3777 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3777 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3777 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52845] It is appreciated that VGAM3777 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3777 host target genes. The mRNA of each one of this plurality of VGAM3777 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3777 RNA, herein designated VGAM RNA, and which when bound by VGAM3777 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3777 host target proteins.

[52846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3777 gene, herein designated VGAM GENE, on one or more VGAM3777 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52847] It is yet further appreciated that a function of VGAM3777 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3777 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM3777 correlate with, and may be deduced from, the identity of the host target genes which VGAM3777 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52848] Nucleotide sequences of the VGAM3777 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3777 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3777 are further described hereinbelow with reference to Table 1.

[52849] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3777 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52850] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3778 (VGAM3778) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52851] VGAM3778 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3778 was detected is described hereinabove with reference to Figs. 2-8.

[52852] VGAM3778 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM3778 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52853] VGAM3778 gene, herein designated VGAM GENE, encodes a VGAM3778 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3778 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3778 precursor RNA is designated SEQ ID:85354, and is provided hereinbelow with reference to the sequence listing part.

[52854] VGAM3778 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52855] An enzyme complex designated DICER COMPLEX, dices the VGAM3778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3778 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3778 RNA is designated SEQ ID:85355, and is provided hereinbelow with reference to the sequence listing part.

[52856] VGAM3778 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3778 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3778 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52857] VGAM3778 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3778 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3778 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3778 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3778 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52858] The complementary binding of VGAM3778 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3778 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3778 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3778 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52859] It is appreciated that VGAM3778 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3778 host target genes. The mRNA of each one of this plurality of VGAM3778 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3778 RNA, herein designated VGAM RNA, and which when bound by VGAM3778 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3778 host target proteins.

[52860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3778 gene, herein designated VGAM GENE, on one or more VGAM3778 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52861] It is yet further appreciated that a function of VGAM3778 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3778 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3778 correlate with, and may be deduced from, the identity of the host target genes which VGAM3778 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52862] Nucleotide sequences of the VGAM3778 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3778 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3778 are further described hereinbelow with reference to Table 1.

[52863] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3778 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52864] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3779 (VGAM3779) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52865] VGAM3779 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3779 was detected is described hereinabove with reference to Figs. 2–8.

[52866] VGAM3779 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mice minute virus. VGAM3779 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52867] VGAM3779 gene, herein designated VGAM GENE, encodes a VGAM3779 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3779 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3779 precursor RNA is designated SEQ ID:85385, and is provided hereinbelow with reference to the sequence listing part.

[52868] VGAM3779 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52869] An enzyme complex designated DICER COMPLEX, dices the VGAM3779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3779 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3779 RNA is designated SEQ ID:85386, and is provided hereinbelow with reference to the sequence listing part.

[52870] VGAM3779 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3779 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3779 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52871] VGAM3779 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3779 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3779 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3779 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3779 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52872] The complementary binding of VGAM3779 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3779 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3779 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3779 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52873] It is appreciated that VGAM3779 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3779 host target genes. The mRNA of each one of this plurality of VGAM3779 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3779 RNA, herein designated VGAM RNA, and which when bound by VGAM3779 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3779 host target proteins.

[52874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3779 gene, herein designated VGAM GENE, on one or more VGAM3779 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[52875] It is yet further appreciated that a function of VGAM3779 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3779 include diagnosis, prevention and treatment of viral infection by Mice minute virus. Specific functions, and accordingly utilities, of VGAM3779 correlate with, and may be deduced from, the identity of the host target genes which VGAM3779 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52876] Nucleotide sequences of the VGAM3779 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3779 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3779 are further described hereinbelow with reference to Table 1.

[52877] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3779 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52878] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3780 (VGAM3780) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52879] VGAM3780 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3780 was detected is described hereinabove with reference to Figs. 2–8.

[52880] VGAM3780 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine adenovirus D. VGAM3780 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52881] VGAM3780 gene, herein designated VGAM GENE, encodes a VGAM3780 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3780 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3780 precursor RNA is designated SEQ ID:85395, and is provided hereinbelow with reference to the sequence listing part.

[52882] VGAM3780 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52883] An enzyme complex designated DICER COMPLEX, dices the VGAM3780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3780 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3780 RNA is designated SEQ ID:85396, and is provided hereinbelow with reference to the sequence listing part.

[52884] VGAM3780 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3780 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3780 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52885] VGAM3780 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3780 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3780 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3780 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3780 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52886] The complementary binding of VGAM3780 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3780 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3780 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3780 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52887] It is appreciated that VGAM3780 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3780 host target genes. The mRNA of

each one of this plurality of VGAM3780 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3780 RNA, herein designated VGAM RNA, and which when bound by VGAM3780 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3780 host target proteins.

[52888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3780 gene, herein designated VGAM GENE, on one or more VGAM3780 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[52889] It is yet further appreciated that a function of VGAM3780 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3780 include diagnosis, prevention and treatment of viral infection by Bovine adenovirus D. Specific functions, and accordingly utilities, of VGAM3780 correlate with, and may be deduced from, the identity of the host target genes which VGAM3780 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52890] Nucleotide sequences of the VGAM3780 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3780 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3780 are further described hereinbelow with reference to Table 1.

[52891] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3780 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[52892] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3781 (VGAM3781) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52893] VGAM3781 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3781 was detected is described hereinabove with reference to Figs. 2–8.

[52894] VGAM3781 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3781 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52895] VGAM3781 gene, herein designated VGAM GENE, encodes a VGAM3781 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3781 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3781 precursor RNA is designated SEQ ID:85402, and is provided hereinbelow with reference to the sequence listing part.

[52896] VGAM3781 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52897] An enzyme complex designated DICER COMPLEX, dices the VGAM3781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3781 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3781 RNA is designated SEQ ID:85403,

and is provided hereinbelow with reference to the sequence listing part.

[52898] VGAM3781 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3781 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3781 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52899] VGAM3781 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3781 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3781 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3781 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3781 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52900] The complementary binding of VGAM3781 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3781 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3781 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3781 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52901] It is appreciated that VGAM3781 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3781 host target genes. The mRNA of each one of this plurality of VGAM3781 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3781 RNA, herein designated VGAM RNA, and which when bound by VGAM3781 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3781 host target proteins.

[52902] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3781 gene, herein designated VGAM GENE, on one or more VGAM3781 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52903] It is yet further appreciated that a function of VGAM3781 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3781 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3781 correlate with, and may be deduced from, the identity of the host target genes which VGAM3781 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52904] Nucleotide sequences of the VGAM3781 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3781 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3781 are further described hereinbelow with reference to Table 1.

[52905] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3781 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52906] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3782 (VGAM3782) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52907] VGAM3782 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3782 was detected is described hereinabove with reference to Figs. 2–8.

[52908] VGAM3782 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM3782 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52909] VGAM3782 gene, herein designated VGAM GENE, encodes a VGAM3782 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3782 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3782 precu-

sor RNA is designated SEQ ID:85408, and is provided hereinbelow with reference to the sequence listing part.

[52910] VGAM3782 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52911] An enzyme complex designated DICER COMPLEX, dices the VGAM3782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3782 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3782 RNA is designated SEQ ID:85409, and is provided hereinbelow with reference to the se-

quence listing part.

[52912] VGAM3782 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3782 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3782 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52913] VGAM3782 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3782 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3782 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3782 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3782 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52914] The complementary binding of VGAM3782 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3782 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3782 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3782 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52915] It is appreciated that VGAM3782 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3782 host target genes. The mRNA of each one of this plurality of VGAM3782 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3782 RNA, herein designated VGAM RNA, and which when bound by VGAM3782 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3782 host target proteins.

[52916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3782 gene, herein designated VGAM GENE, on one or more VGAM3782 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52917] It is yet further appreciated that a function of VGAM3782

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3782 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3782 correlate with, and may be deduced from, the identity of the host target genes which VGAM3782 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52918] Nucleotide sequences of the VGAM3782 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3782 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3782 are further described hereinbelow with reference to Table 1.

[52919] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3782 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52920] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3783 (VGAM3783) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52921] VGAM3783 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3783 was detected is described hereinabove with reference to Figs. 2–8.

[52922] VGAM3783 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3783 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52923] VGAM3783 gene, herein designated VGAM GENE, encodes a VGAM3783 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3783 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3783 precursor RNA is designated SEQ ID:85411, and is provided

hereinbelow with reference to the sequence listing part.

[52924] VGAM3783 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52925] An enzyme complex designated DICER COMPLEX, dices the VGAM3783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3783 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3783 RNA is designated SEQ ID:85412, and is provided hereinbelow with reference to the sequence listing part.

[52926] VGAM3783 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3783 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3783 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52927] VGAM3783 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3783 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3783 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3783 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3783 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52928] The complementary binding of VGAM3783 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3783 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3783 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3783 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52929] It is appreciated that VGAM3783 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3783 host target genes. The mRNA of each one of this plurality of VGAM3783 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3783 RNA, herein designated VGAM RNA, and which when bound by VGAM3783 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3783 host target proteins.

[52930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3783 gene, herein designated VGAM GENE, on one or more VGAM3783 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52931] It is yet further appreciated that a function of VGAM3783 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3783 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3783 correlate with, and may be deduced from, the identity of the host target genes which VGAM3783 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52932] Nucleotide sequences of the VGAM3783 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3783 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3783 are further described hereinbelow with reference to Table 1.

[52933] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3783 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52934] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3784 (VGAM3784) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52935] VGAM3784 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3784 was detected is described hereinabove with reference to Figs. 2–8.

[52936] VGAM3784 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3784 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52937] VGAM3784 gene, herein designated VGAM GENE, encodes a VGAM3784 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3784 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3784 precursor RNA is designated SEQ ID:85566, and is provided hereinbelow with reference to the sequence listing part.

[52938] VGAM3784 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52939] An enzyme complex designated DICER COMPLEX, dices the VGAM3784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3784 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3784 RNA is designated SEQ ID:85567, and is provided hereinbelow with reference to the sequence listing part.

[52940] VGAM3784 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3784 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3784 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52941] VGAM3784 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3784 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3784 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3784 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3784 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52942] The complementary binding of VGAM3784 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3784 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3784 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3784 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52943] It is appreciated that VGAM3784 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3784 host target genes. The mRNA of each one of this plurality of VGAM3784 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3784 RNA, herein designated VGAM

RNA, and which when bound by VGAM3784 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3784 host target proteins.

[52944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3784 gene, herein designated VGAM GENE, on one or more VGAM3784 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52945] It is yet further appreciated that a function of VGAM3784 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3784 include diagnosis, prevention and treatment of viral infection by Mollusum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3784 correlate with, and may be deduced from, the identity of the host target genes which VGAM3784 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52946] Nucleotide sequences of the VGAM3784 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3784 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3784 are further described hereinbelow with reference to Table 1.

[52947] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3784 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52948] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3785 (VGAM3785) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52949] VGAM3785 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3785 was detected is described hereinabove with reference to Figs. 2-8.

[52950] VGAM3785 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3785 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52951] VGAM3785 gene, herein designated VGAM GENE, encodes a VGAM3785 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3785 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3785 precursor RNA is designated SEQ ID:85581, and is provided hereinbelow with reference to the sequence listing part.

[52952] VGAM3785 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52953] An enzyme complex designated DICER COMPLEX, dices the VGAM3785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3785 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3785 RNA is designated SEQ ID:85582, and is provided hereinbelow with reference to the sequence listing part.

[52954] VGAM3785 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3785 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3785 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52955] VGAM3785 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3785 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3785 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3785 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3785 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52956] The complementary binding of VGAM3785 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3785 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3785 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3785 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52957] It is appreciated that VGAM3785 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3785 host target genes. The mRNA of each one of this plurality of VGAM3785 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3785 RNA, herein designated VGAM RNA, and which when bound by VGAM3785 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3785 host target proteins.

[52958] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3785 gene, herein designated VGAM GENE, on one or more VGAM3785 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52959] It is yet further appreciated that a function of VGAM3785 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3785 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3785 correlate with, and may be deduced from, the identity of the host target genes which VGAM3785 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52960] Nucleotide sequences of the VGAM3785 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3785 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3785 are further described hereinbelow with reference to Table 1.

[52961] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3785 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52962] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3786 (VGAM3786) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52963] VGAM3786 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3786 was detected is described hereinabove with reference to Figs. 2–8.

[52964] VGAM3786 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox virus. VGAM3786 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52965] VGAM3786 gene, herein designated VGAM GENE, encodes a VGAM3786 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3786 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3786 precursor RNA is designated SEQ ID:85628, and is provided hereinbelow with reference to the sequence listing part.

[52966] VGAM3786 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3786 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52967] An enzyme complex designated DICER COMPLEX, dices the VGAM3786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3786 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3786 RNA is designated SEQ ID:85629, and is provided hereinbelow with reference to the sequence listing part.

[52968] VGAM3786 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3786 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3786 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52969] VGAM3786 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3786 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3786 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3786 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3786 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52970] The complementary binding of VGAM3786 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3786 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3786 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3786 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52971] It is appreciated that VGAM3786 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3786 host target genes. The mRNA of each one of this plurality of VGAM3786 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3786 RNA, herein designated VGAM RNA, and which when bound by VGAM3786 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3786 host target proteins.

[52972] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3786 gene, herein designated VGAM GENE, on one or more VGAM3786 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52973] It is yet further appreciated that a function of VGAM3786 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3786 include diagnosis, prevention and treatment of viral infection by Sheeppox virus. Specific

functions, and accordingly utilities, of VGAM3786 correlate with, and may be deduced from, the identity of the host target genes which VGAM3786 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52974] Nucleotide sequences of the VGAM3786 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3786 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3786 are further described hereinbelow with reference to Table 1.

[52975] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3786 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52976] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3787 (VGAM3787) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[52977] VGAM3787 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3787 was detected is described hereinabove with reference to Figs. 2–8.

[52978] VGAM3787 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3787 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52979] VGAM3787 gene, herein designated VGAM GENE, encodes a VGAM3787 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3787 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3787 precursor RNA is designated SEQ ID:85638, and is provided hereinbelow with reference to the sequence listing part.

[52980] VGAM3787 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3787 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52981] An enzyme complex designated DICER COMPLEX, dices the VGAM3787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3787 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3787 RNA is designated SEQ ID:85639, and is provided hereinbelow with reference to the sequence listing part.

[52982] VGAM3787 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3787 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3787 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52983] VGAM3787 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3787 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3787 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3787 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3787 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52984] The complementary binding of VGAM3787 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3787 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3787 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3787 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52985] It is appreciated that VGAM3787 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3787 host target genes. The mRNA of each one of this plurality of VGAM3787 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3787 RNA, herein designated VGAM RNA, and which when bound by VGAM3787 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3787 host target proteins.

[52986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3787 gene, herein designated VGAM GENE, on one or more VGAM3787 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[52987] It is yet further appreciated that a function of VGAM3787 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3787 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3787

correlate with, and may be deduced from, the identity of the host target genes which VGAM3787 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52988] Nucleotide sequences of the VGAM3787 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3787 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3787 are further described hereinbelow with reference to Table 1.

[52989] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3787 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52990] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3788 (VGAM3788) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[52991] VGAM3788 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3788 was detected is described hereinabove with reference to Figs. 2–8.

[52992] VGAM3788 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3788 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52993] VGAM3788 gene, herein designated VGAM GENE, encodes a VGAM3788 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3788 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3788 precursor RNA is designated SEQ ID:85689, and is provided hereinbelow with reference to the sequence listing part.

[52994] VGAM3788 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52995] An enzyme complex designated DICER COMPLEX, dices the VGAM3788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3788 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3788 RNA is designated SEQ ID:85690, and is provided hereinbelow with reference to the sequence listing part.

[52996] VGAM3788 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3788 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3788 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[52997] VGAM3788 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3788 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3788 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3788 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3788 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[52998] The complementary binding of VGAM3788 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3788 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3788 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3788 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52999] It is appreciated that VGAM3788 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3788 host target genes. The mRNA of each one of this plurality of VGAM3788 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3788 RNA, herein designated VGAM RNA, and which when bound by VGAM3788 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3788 host target proteins.

[53000] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3788 gene, herein designated VGAM GENE, on one or more VGAM3788 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53001] It is yet further appreciated that a function of VGAM3788 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3788 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3788 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3788 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53002] Nucleotide sequences of the VGAM3788 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3788 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3788 are further described hereinbelow with reference to Table 1.

[53003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3788 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53004] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3789 (VGAM3789) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53005] VGAM3789 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3789 was detected is described hereinabove with reference to Figs. 2–8.

[53006] VGAM3789 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3789 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53007] VGAM3789 gene, herein designated VGAM GENE, encodes a VGAM3789 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3789 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3789 precursor RNA is designated SEQ ID:85700, and is provided hereinbelow with reference to the sequence listing part.

[53008] VGAM3789 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53009] An enzyme complex designated DICER COMPLEX, dices the VGAM3789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3789 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3789 RNA is designated SEQ ID:85701, and is provided hereinbelow with reference to the sequence listing part.

[53010] VGAM3789 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3789 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3789 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53011] VGAM3789 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3789 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3789 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3789 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3789 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53012] The complementary binding of VGAM3789 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3789 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3789 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3789 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53013] It is appreciated that VGAM3789 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3789 host target genes. The mRNA of each one of this plurality of VGAM3789 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3789 RNA, herein designated VGAM RNA, and which when bound by VGAM3789 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3789 host target proteins.

[53014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3789 gene, herein designated VGAM GENE, on one or more VGAM3789 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53015] It is yet further appreciated that a function of VGAM3789 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3789 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3789 correlate with, and may be deduced from, the identity of the host target genes which VGAM3789 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53016] Nucleotide sequences of the VGAM3789 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3789 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3789 are further described hereinbelow with reference to Table 1.

[53017] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3789 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53018] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3790 (VGAM3790) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53019] VGAM3790 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3790 was detected is described hereinabove with reference to Figs. 2-8.

[53020] VGAM3790 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3790 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53021] VGAM3790 gene, herein designated VGAM GENE, encodes

a VGAM3790 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3790 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3790 precursor RNA is designated SEQ ID:85706, and is provided hereinbelow with reference to the sequence listing part.

[53022] VGAM3790 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53023] An enzyme complex designated DICER COMPLEX, dices the VGAM3790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3790 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3790 RNA is designated SEQ ID:85707, and is provided hereinbelow with reference to the sequence listing part.

[53024] VGAM3790 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3790 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3790 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53025] VGAM3790 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3790 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3790 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3790 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3790 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53026] The complementary binding of VGAM3790 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3790 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3790 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3790 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[53027] It is appreciated that VGAM3790 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3790 host target genes. The mRNA of each one of this plurality of VGAM3790 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3790 RNA, herein designated VGAM RNA, and which when bound by VGAM3790 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3790 host target proteins.

[53028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3790 gene, herein designated VGAM GENE, on one or more VGAM3790 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53029] It is yet further appreciated that a function of VGAM3790 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3790 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3790 correlate with, and may be deduced from, the identity of the host target genes which VGAM3790 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53030] Nucleotide sequences of the VGAM3790 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3790 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3790 are further described hereinbelow with reference to Table 1.

[53031] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3790 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53032] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3791 (VGAM3791) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53033] VGAM3791 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3791 was detected is described hereinabove with reference to Figs. 2-8.

[53034] VGAM3791 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine rhinitis A virus. VGAM3791 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53035] VGAM3791 gene, herein designated VGAM GENE, encodes a VGAM3791 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3791 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3791 precursor RNA is designated SEQ ID:85716, and is provided hereinbelow with reference to the sequence listing part.

[53036] VGAM3791 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53037] An enzyme complex designated DICER COMPLEX, dices the VGAM3791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3791 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3791 RNA is designated SEQ ID:85717, and is provided hereinbelow with reference to the sequence listing part.

[53038] VGAM3791 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3791 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3791 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53039] VGAM3791 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3791 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3791 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3791 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3791 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53040] The complementary binding of VGAM3791 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3791 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3791 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3791 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53041] It is appreciated that VGAM3791 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3791 host target genes. The mRNA of each one of this plurality of VGAM3791 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3791 RNA, herein designated VGAM RNA, and which when bound by VGAM3791 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3791 host target proteins.

[53042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3791 gene, herein designated VGAM GENE, on one or more VGAM3791 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53043] It is yet further appreciated that a function of VGAM3791 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3791 include diagnosis, prevention and treatment of viral infection by Equine rhinitis A virus. Specific functions, and accordingly utilities, of VGAM3791 correlate with, and may be deduced from, the identity of the host target genes which VGAM3791 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53044] Nucleotide sequences of the VGAM3791 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3791 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3791 are further described hereinbelow with reference to Table 1.

[53045] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3791 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53046] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3792 (VGAM3792) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53047] VGAM3792 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3792 was detected is described hereinabove with reference to Figs. 2-8.

[53048] VGAM3792 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3792 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53049] VGAM3792 gene, herein designated VGAM GENE, encodes a VGAM3792 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3792 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3792 precursor RNA is designated SEQ ID:85740, and is provided hereinbelow with reference to the sequence listing part.

[53050] VGAM3792 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53051] An enzyme complex designated DICER COMPLEX, dices the VGAM3792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3792 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3792 RNA is designated SEQ ID:85741, and is provided hereinbelow with reference to the sequence listing part.

[53052] VGAM3792 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3792 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3792 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53053] VGAM3792 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3792 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3792 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3792 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3792 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53054] The complementary binding of VGAM3792 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3792 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3792 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3792 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53055] It is appreciated that VGAM3792 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3792 host target genes. The mRNA of each one of this plurality of VGAM3792 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3792 RNA, herein designated VGAM RNA, and which when bound by VGAM3792 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3792 host target proteins.

[53056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3792 gene, herein designated VGAM GENE, on one or more VGAM3792 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53057] It is yet further appreciated that a function of VGAM3792 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3792 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3792 correlate with, and may be deduced from, the identity of the host target genes which VGAM3792 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53058] Nucleotide sequences of the VGAM3792 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3792 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3792 are further described hereinbelow with reference to Table 1.

[53059] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3792 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53060] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3793 (VGAM3793) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53061] VGAM3793 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3793 was detected is described hereinabove with reference to Figs. 2–8.

[53062] VGAM3793 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM3793 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53063] VGAM3793 gene, herein designated VGAM GENE, encodes a VGAM3793 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3793 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3793 precursor RNA is designated SEQ ID:85756, and is provided hereinbelow with reference to the sequence listing part.

[53064] VGAM3793 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53065] An enzyme complex designated DICER COMPLEX, dices the VGAM3793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3793 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3793 RNA is designated SEQ ID:85757, and is provided hereinbelow with reference to the sequence listing part.

[53066] VGAM3793 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3793 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3793 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53067] VGAM3793 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3793 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3793 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3793 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3793 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53068] The complementary binding of VGAM3793 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3793 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3793 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3793 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53069] It is appreciated that VGAM3793 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3793 host target genes. The mRNA of each one of this plurality of VGAM3793 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3793 RNA, herein designated VGAM RNA, and which when bound by VGAM3793 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3793 host target proteins.

[53070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3793 gene, herein designated VGAM GENE, on one or more VGAM3793 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[53071] It is yet further appreciated that a function of VGAM3793 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3793 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM3793 correlate with, and may be deduced from, the identity of the host target genes which VGAM3793 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53072] Nucleotide sequences of the VGAM3793 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3793 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3793 are further described hereinbelow with reference to Table 1.

[53073] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3793 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53074] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3794 (VGAM3794) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53075] VGAM3794 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3794 was detected is described hereinabove with reference to Figs. 2-8.

[53076] VGAM3794 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice ragged stunt virus. VGAM3794 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53077] VGAM3794 gene, herein designated VGAM GENE, encodes a VGAM3794 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3794 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3794 precursor RNA is designated SEQ ID:85761, and is provided hereinbelow with reference to the sequence listing part.

[53078] VGAM3794 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53079] An enzyme complex designated DICER COMPLEX, dices the VGAM3794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3794 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3794 RNA is designated SEQ ID:85762, and is provided hereinbelow with reference to the sequence listing part.

[53080] VGAM3794 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3794 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3794 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53081] VGAM3794 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3794 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3794 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3794 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3794 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53082] The complementary binding of VGAM3794 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3794 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3794 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3794 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53083] It is appreciated that VGAM3794 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3794 host target genes. The mRNA of

each one of this plurality of VGAM3794 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3794 RNA, herein designated VGAM RNA, and which when bound by VGAM3794 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3794 host target proteins.

[53084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3794 gene, herein designated VGAM GENE, on one or more VGAM3794 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[53085] It is yet further appreciated that a function of VGAM3794 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3794 include diagnosis, prevention and treatment of viral infection by Rice ragged stunt virus. Specific functions, and accordingly utilities, of VGAM3794 correlate with, and may be deduced from, the identity of the host target genes which VGAM3794 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53086] Nucleotide sequences of the VGAM3794 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3794 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3794 are further described hereinbelow with reference to Table 1.

[53087] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3794 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[53088] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3795 (VGAM3795) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53089] VGAM3795 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3795 was detected is described hereinabove with reference to Figs. 2–8.

[53090] VGAM3795 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM3795 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53091] VGAM3795 gene, herein designated VGAM GENE, encodes a VGAM3795 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3795 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3795 precursor RNA is designated SEQ ID:85839, and is provided hereinbelow with reference to the sequence listing part.

[53092] VGAM3795 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53093] An enzyme complex designated DICER COMPLEX, dices the VGAM3795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3795 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3795 RNA is designated SEQ ID:85840,

and is provided hereinbelow with reference to the sequence listing part.

[53094] VGAM3795 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3795 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3795 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53095] VGAM3795 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3795 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3795 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3795 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3795 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53096] The complementary binding of VGAM3795 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3795 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3795 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3795 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53097] It is appreciated that VGAM3795 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3795 host target genes. The mRNA of each one of this plurality of VGAM3795 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3795 RNA, herein designated VGAM RNA, and which when bound by VGAM3795 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3795 host target proteins.

[53098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3795 gene, herein designated VGAM GENE, on one or more VGAM3795 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53099] It is yet further appreciated that a function of VGAM3795 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3795 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3795 correlate with, and may be deduced from, the identity of the host target genes which VGAM3795 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53100] Nucleotide sequences of the VGAM3795 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3795 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3795 are further described hereinbelow with reference to Table 1.

[53101] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3795 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53102] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3796 (VGAM3796) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53103] VGAM3796 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3796 was detected is described hereinabove with reference to Figs. 2–8.

[53104] VGAM3796 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3796 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53105] VGAM3796 gene, herein designated VGAM GENE, encodes a VGAM3796 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3796 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3796 precu-

sor RNA is designated SEQ ID:85842, and is provided hereinbelow with reference to the sequence listing part.

[53106] VGAM3796 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53107] An enzyme complex designated DICER COMPLEX, dices the VGAM3796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3796 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3796 RNA is designated SEQ ID:85843, and is provided hereinbelow with reference to the se-

quence listing part.

[53108] VGAM3796 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3796 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3796 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53109] VGAM3796 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3796 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3796 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3796 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3796 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53110] The complementary binding of VGAM3796 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3796 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3796 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3796 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53111] It is appreciated that VGAM3796 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3796 host target genes. The mRNA of each one of this plurality of VGAM3796 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3796 RNA, herein designated VGAM RNA, and which when bound by VGAM3796 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3796 host target proteins.

[53112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3796 gene, herein designated VGAM GENE, on one or more VGAM3796 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53113] It is yet further appreciated that a function of VGAM3796

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3796 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3796 correlate with, and may be deduced from, the identity of the host target genes which VGAM3796 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53114] Nucleotide sequences of the VGAM3796 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3796 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3796 are further described hereinbelow with reference to Table 1.

[53115] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3796 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53116] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3797 (VGAM3797) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53117] VGAM3797 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3797 was detected is described hereinabove with reference to Figs. 2–8.

[53118] VGAM3797 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3797 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53119] VGAM3797 gene, herein designated VGAM GENE, encodes a VGAM3797 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3797 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3797 precursor RNA is designated SEQ ID:85865, and is provided

hereinbelow with reference to the sequence listing part.

[53120] VGAM3797 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53121] An enzyme complex designated DICER COMPLEX, dices the VGAM3797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3797 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3797 RNA is designated SEQ ID:85866, and is provided hereinbelow with reference to the sequence listing part.

[53122] VGAM3797 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3797 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3797 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53123] VGAM3797 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3797 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3797 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3797 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3797 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53124] The complementary binding of VGAM3797 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3797 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3797 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3797 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53125] It is appreciated that VGAM3797 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3797 host target genes. The mRNA of each one of this plurality of VGAM3797 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3797 RNA, herein designated VGAM RNA, and which when bound by VGAM3797 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3797 host target proteins.

[53126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3797 gene, herein designated VGAM GENE, on one or more VGAM3797 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53127] It is yet further appreciated that a function of VGAM3797 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3797 include diagnosis, prevention and treatment of viral infection by *Paramecium bursaria* Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3797 correlate with, and may be deduced from, the identity of the host target genes which VGAM3797 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53128] Nucleotide sequences of the VGAM3797 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3797 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3797 are further described hereinbelow with reference to Table 1.

[53129] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3797 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53130] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3798 (VGAM3798) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53131] VGAM3798 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3798 was detected is described hereinabove with reference to Figs. 2–8.

[53132] VGAM3798 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM3798 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53133] VGAM3798 gene, herein designated VGAM GENE, encodes a VGAM3798 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3798 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3798 precursor RNA is designated SEQ ID:85869, and is provided hereinbelow with reference to the sequence listing part.

[53134] VGAM3798 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53135] An enzyme complex designated DICER COMPLEX, dices the VGAM3798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3798 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3798 RNA is designated SEQ ID:85870, and is provided hereinbelow with reference to the sequence listing part.

[53136] VGAM3798 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3798 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3798 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53137] VGAM3798 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3798 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3798 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3798 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3798 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53138] The complementary binding of VGAM3798 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3798 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3798 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3798 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53139] It is appreciated that VGAM3798 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3798 host target genes. The mRNA of each one of this plurality of VGAM3798 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3798 RNA, herein designated VGAM

RNA, and which when bound by VGAM3798 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3798 host target proteins.

[53140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3798 gene, herein designated VGAM GENE, on one or more VGAM3798 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53141] It is yet further appreciated that a function of VGAM3798 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3798 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM3798 correlate with, and may be deduced from, the identity of the host target genes which VGAM3798 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53142] Nucleotide sequences of the VGAM3798 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3798 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3798 are further described hereinbelow with reference to Table 1.

[53143] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3798 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53144] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3799 (VGAM3799) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53145] VGAM3799 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3799 was detected is described hereinabove with reference to Figs. 2-8.

[53146] VGAM3799 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3799 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53147] VGAM3799 gene, herein designated VGAM GENE, encodes a VGAM3799 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3799 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3799 precursor RNA is designated SEQ ID:85882, and is provided hereinbelow with reference to the sequence listing part.

[53148] VGAM3799 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53149] An enzyme complex designated DICER COMPLEX, dices the VGAM3799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3799 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3799 RNA is designated SEQ ID:85883, and is provided hereinbelow with reference to the sequence listing part.

[53150] VGAM3799 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3799 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3799 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53151] VGAM3799 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3799 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3799 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3799 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3799 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53152] The complementary binding of VGAM3799 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3799 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3799 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3799 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53153] It is appreciated that VGAM3799 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3799 host target genes. The mRNA of each one of this plurality of VGAM3799 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3799 RNA, herein designated VGAM RNA, and which when bound by VGAM3799 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3799 host target proteins.

[53154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3799 gene, herein designated VGAM GENE, on one or more VGAM3799 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53155] It is yet further appreciated that a function of VGAM3799 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3799 include diagnosis, prevention and

treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3799 correlate with, and may be deduced from, the identity of the host target genes which VGAM3799 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53156] Nucleotide sequences of the VGAM3799 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3799 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3799 are further described hereinbelow with reference to Table 1.

[53157] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3799 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53158] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3800 (VGAM3800) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53159] VGAM3800 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3800 was detected is described hereinabove with reference to Figs. 2–8.

[53160] VGAM3800 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM3800 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53161] VGAM3800 gene, herein designated VGAM GENE, encodes a VGAM3800 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3800 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3800 precursor RNA is designated SEQ ID:86161, and is provided hereinbelow with reference to the sequence listing part.

[53162] VGAM3800 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3800 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53163] An enzyme complex designated DICER COMPLEX, dices the VGAM3800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3800 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3800 RNA is designated SEQ ID:86162, and is provided hereinbelow with reference to the sequence listing part.

[53164] VGAM3800 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3800 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3800 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53165] VGAM3800 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3800 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3800 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3800 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3800 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53166] The complementary binding of VGAM3800 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3800 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3800 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3800 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53167] It is appreciated that VGAM3800 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3800 host target genes. The mRNA of each one of this plurality of VGAM3800 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3800 RNA, herein designated VGAM RNA, and which when bound by VGAM3800 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3800 host target proteins.

[53168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3800 gene, herein designated VGAM GENE, on one or more VGAM3800 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53169] It is yet further appreciated that a function of VGAM3800 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3800 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadi-

novirus. Specific functions, and accordingly utilities, of VGAM3800 correlate with, and may be deduced from, the identity of the host target genes which VGAM3800 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53170] Nucleotide sequences of the VGAM3800 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3800 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3800 are further described hereinbelow with reference to Table 1.

[53171] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3800 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53172] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3801 (VGAM3801) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[53173] VGAM3801 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3801 was detected is described hereinabove with reference to Figs. 2–8.

[53174] VGAM3801 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3801 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53175] VGAM3801 gene, herein designated VGAM GENE, encodes a VGAM3801 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3801 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3801 precursor RNA is designated SEQ ID:86165, and is provided hereinbelow with reference to the sequence listing part.

[53176] VGAM3801 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3801 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53177] An enzyme complex designated DICER COMPLEX, dices the VGAM3801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3801 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3801 RNA is designated SEQ ID:86166, and is provided hereinbelow with reference to the sequence listing part.

[53178] VGAM3801 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3801 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3801 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53179] VGAM3801 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3801 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3801 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3801 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3801 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53180] The complementary binding of VGAM3801 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3801 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3801 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3801 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53181] It is appreciated that VGAM3801 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3801 host target genes. The mRNA of each one of this plurality of VGAM3801 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3801 RNA, herein designated VGAM RNA, and which when bound by VGAM3801 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3801 host target proteins.

[53182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3801 gene, herein designated VGAM GENE, on one or more VGAM3801 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53183] It is yet further appreciated that a function of VGAM3801 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3801 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3801

correlate with, and may be deduced from, the identity of the host target genes which VGAM3801 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53184] Nucleotide sequences of the VGAM3801 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3801 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3801 are further described hereinbelow with reference to Table 1.

[53185] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3801 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53186] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3802 (VGAM3802) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[53187] VGAM3802 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3802 was detected is described hereinabove with reference to Figs. 2–8.

[53188] VGAM3802 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3802 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53189] VGAM3802 gene, herein designated VGAM GENE, encodes a VGAM3802 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3802 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3802 precursor RNA is designated SEQ ID:86184, and is provided hereinbelow with reference to the sequence listing part.

[53190] VGAM3802 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53191] An enzyme complex designated DICER COMPLEX, dices the VGAM3802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3802 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3802 RNA is designated SEQ ID:86185, and is provided hereinbelow with reference to the sequence listing part.

[53192] VGAM3802 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3802 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3802 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53193] VGAM3802 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3802 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3802 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3802 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3802 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53194] The complementary binding of VGAM3802 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3802 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3802 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3802 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53195] It is appreciated that VGAM3802 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3802 host target genes. The mRNA of each one of this plurality of VGAM3802 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3802 RNA, herein designated VGAM RNA, and which when bound by VGAM3802 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3802 host target proteins.

[53196] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3802 gene, herein designated VGAM GENE, on one or more VGAM3802 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53197] It is yet further appreciated that a function of VGAM3802 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3802 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3802 correlate with, and may be deduced from, the

identity of the host target genes which VGAM3802 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53198] Nucleotide sequences of the VGAM3802 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3802 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3802 are further described hereinbelow with reference to Table 1.

[53199] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3802 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53200] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3803 (VGAM3803) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53201] VGAM3803 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3803 was detected is described hereinabove with reference to Figs. 2–8.

[53202] VGAM3803 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3803 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53203] VGAM3803 gene, herein designated VGAM GENE, encodes a VGAM3803 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3803 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3803 precursor RNA is designated SEQ ID:86195, and is provided hereinbelow with reference to the sequence listing part.

[53204] VGAM3803 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53205] An enzyme complex designated DICER COMPLEX, dices the VGAM3803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3803 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3803 RNA is designated SEQ ID:86196, and is provided hereinbelow with reference to the sequence listing part.

[53206] VGAM3803 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3803 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3803 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53207] VGAM3803 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3803 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3803 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3803 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3803 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53208] The complementary binding of VGAM3803 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3803 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3803 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3803 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53209] It is appreciated that VGAM3803 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3803 host target genes. The mRNA of each one of this plurality of VGAM3803 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3803 RNA, herein designated VGAM RNA, and which when bound by VGAM3803 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3803 host target proteins.

[53210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3803 gene, herein designated VGAM GENE, on one or more VGAM3803 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53211] It is yet further appreciated that a function of VGAM3803 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3803 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3803 correlate with, and may be deduced from, the identity of the host target genes which VGAM3803 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53212] Nucleotide sequences of the VGAM3803 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3803 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3803 are further described hereinbelow with reference to Table 1.

[53213] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3803 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53214] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3804 (VGAM3804) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53215] VGAM3804 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3804 was detected is described hereinabove with reference to Figs. 2–8.

[53216] VGAM3804 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 41. VGAM3804 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53217] VGAM3804 gene, herein designated VGAM GENE, encodes a VGAM3804 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3804 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3804 precursor RNA is designated SEQ ID:86259, and is provided hereinbelow with reference to the sequence listing part.

[53218] VGAM3804 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53219] An enzyme complex designated DICER COMPLEX, dices the VGAM3804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3804 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3804 RNA is designated SEQ ID:86260, and is provided hereinbelow with reference to the sequence listing part.

[53220] VGAM3804 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3804 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3804 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53221] VGAM3804 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3804 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3804 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3804 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3804 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[53222] The complementary binding of VGAM3804 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3804 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3804 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3804 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53223] It is appreciated that VGAM3804 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3804 host target genes. The mRNA of each one of this plurality of VGAM3804 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3804 RNA, herein designated VGAM RNA, and which when bound by VGAM3804 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3804 host target proteins.

[53224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3804 gene, herein designated VGAM GENE, on one or more VGAM3804 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53225] It is yet further appreciated that a function of VGAM3804 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3804 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 41. Specific functions, and accordingly utilities, of VGAM3804 correlate with, and may be deduced from, the identity of the host target genes which VGAM3804 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[53226] Nucleotide sequences of the VGAM3804 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3804 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3804 are further described hereinbelow with reference to Table 1.

[53227] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3804 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53228] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3805 (VGAM3805) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53229] VGAM3805 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3805 was detected is described hereinabove with reference to Figs. 2–8.

[53230] VGAM3805 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM3805 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53231] VGAM3805 gene, herein designated VGAM GENE, encodes a VGAM3805 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3805 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3805 precursor RNA is designated SEQ ID:86370, and is provided hereinbelow with reference to the sequence listing part.

[53232] VGAM3805 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53233] An enzyme complex designated DICER COMPLEX, dices the VGAM3805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3805 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3805 RNA is designated SEQ ID:86371, and is provided hereinbelow with reference to the sequence listing part.

[53234] VGAM3805 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3805 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3805 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[53235] VGAM3805 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3805 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3805 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3805 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3805 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53236] The complementary binding of VGAM3805 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3805 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3805 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3805 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53237] It is appreciated that VGAM3805 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3805 host target genes. The mRNA of each one of this plurality of VGAM3805 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3805 RNA, herein designated VGAM RNA, and which when bound by VGAM3805 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3805 host target proteins.

[53238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3805 gene, herein designated VGAM GENE, on one

or more VGAM3805 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53239] It is yet further appreciated that a function of VGAM3805 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3805 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3805 correlate with, and may be deduced from, the identity of the host target genes which VGAM3805 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53240] Nucleotide sequences of the VGAM3805 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3805 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3805 are further described hereinbelow with reference to Table 1.

[53241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3805 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53242] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3806 (VGAM3806) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53243] VGAM3806 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3806 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[53244] VGAM3806 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3806 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53245] VGAM3806 gene, herein designated VGAM GENE, encodes a VGAM3806 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3806 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3806 precursor RNA is designated SEQ ID:86380, and is provided hereinbelow with reference to the sequence listing part.

[53246] VGAM3806 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53247] An enzyme complex designated DICER COMPLEX, dices the VGAM3806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3806 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3806 RNA is designated SEQ ID:86381, and is provided hereinbelow with reference to the sequence listing part.

[53248] VGAM3806 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3806 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3806 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53249] VGAM3806 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3806 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3806 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3806 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3806 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53250] The complementary binding of VGAM3806 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3806 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3806 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3806 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53251] It is appreciated that VGAM3806 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3806 host target genes. The mRNA of each one of this plurality of VGAM3806 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3806 RNA, herein designated VGAM RNA, and which when bound by VGAM3806 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3806 host target proteins.

[53252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3806 gene, herein designated VGAM GENE, on one or more VGAM3806 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53253] It is yet further appreciated that a function of VGAM3806 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3806 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3806 correlate with, and may be deduced from, the identity of the host target genes which VGAM3806 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53254] Nucleotide sequences of the VGAM3806 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3806 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3806 are further described hereinbelow with reference to Table 1.

[53255] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3806 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53256] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3807 (VGAM3807) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53257] VGAM3807 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3807 was detected is described hereinabove with reference to Figs. 2-8.

[53258] VGAM3807 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus.

VGAM3807 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53259] VGAM3807 gene, herein designated VGAM GENE, encodes a VGAM3807 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3807 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3807 precursor RNA is designated SEQ ID:86386, and is provided hereinbelow with reference to the sequence listing part.

[53260] VGAM3807 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[53261] An enzyme complex designated DICER COMPLEX, dices the VGAM3807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3807 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3807 RNA is designated SEQ ID:86387, and is provided hereinbelow with reference to the sequence listing part.

[53262] VGAM3807 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3807 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3807 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53263] VGAM3807 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3807 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3807 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3807 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3807 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53264] The complementary binding of VGAM3807 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3807 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3807 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3807 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53265] It is appreciated that VGAM3807 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3807 host target genes. The mRNA of each one of this plurality of VGAM3807 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3807 RNA, herein designated VGAM RNA, and which when bound by VGAM3807 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3807 host target proteins.

[53266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3807 gene, herein designated VGAM GENE, on one or more VGAM3807 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53267] It is yet further appreciated that a function of VGAM3807 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3807 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM3807 correlate with, and may be deduced from, the identity of the host target genes which VGAM3807 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53268] Nucleotide sequences of the VGAM3807 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3807 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3807 are further described hereinbelow with reference to Table 1.

[53269] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3807 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53270] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3808 (VGAM3808) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53271] VGAM3808 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3808 was detected is described hereinabove with reference to Figs. 2-8.

[53272] VGAM3808 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine herpesvirus 1. VGAM3808 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53273] VGAM3808 gene, herein designated VGAM GENE, encodes a VGAM3808 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3808 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3808 precursor RNA is designated SEQ ID:86399, and is provided hereinbelow with reference to the sequence listing part.

[53274] VGAM3808 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53275] An enzyme complex designated DICER COMPLEX, dices the VGAM3808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3808 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3808 RNA is designated SEQ ID:86400, and is provided hereinbelow with reference to the sequence listing part.

[53276] VGAM3808 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3808 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3808 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53277] VGAM3808 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3808 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3808 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3808 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3808 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53278] The complementary binding of VGAM3808 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3808 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3808 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3808 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53279] It is appreciated that VGAM3808 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3808 host target genes. The mRNA of each one of this plurality of VGAM3808 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3808 RNA, herein designated VGAM RNA, and which when bound by VGAM3808 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3808 host target proteins.

[53280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3808 gene, herein designated VGAM GENE, on one or more VGAM3808 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53281] It is yet further appreciated that a function of VGAM3808 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3808 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3808 correlate with, and may be deduced from, the identity of the host target genes which VGAM3808 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53282] Nucleotide sequences of the VGAM3808 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3808 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3808 are further described hereinbelow with reference to Table 1.

[53283] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3808 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53284] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3809 (VGAM3809) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53285] VGAM3809 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3809 was detected is described hereinabove with reference to Figs. 2-8.

[53286] VGAM3809 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lettuce infectious yel-

lows virus. VGAM3809 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53287] VGAM3809 gene, herein designated VGAM GENE, encodes a VGAM3809 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3809 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3809 precursor RNA is designated SEQ ID:86480, and is provided hereinbelow with reference to the sequence listing part.

[53288] VGAM3809 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53289] An enzyme complex designated DICER COMPLEX, dices

the VGAM3809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3809 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3809 RNA is designated SEQ ID:86481, and is provided hereinbelow with reference to the sequence listing part.

[53290] VGAM3809 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3809 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3809 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53291] VGAM3809 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3809 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3809 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3809 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3809 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53292] The complementary binding of VGAM3809 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3809 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3809 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3809 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53293] It is appreciated that VGAM3809 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3809 host target genes. The mRNA of each one of this plurality of VGAM3809 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3809 RNA, herein designated VGAM RNA, and which when bound by VGAM3809 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3809 host target proteins.

[53294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3809 gene, herein designated VGAM GENE, on one or more VGAM3809 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53295] It is yet further appreciated that a function of VGAM3809 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3809 include diagnosis, prevention and treatment of viral infection by Lettuce infectious yellows virus. Specific functions, and accordingly utilities, of VGAM3809 correlate with, and may be deduced from, the identity of the host target genes which VGAM3809 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53296] Nucleotide sequences of the VGAM3809 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3809 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3809 are further described hereinbelow with reference to Table 1.

[53297] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3809 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53298] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3810 (VGAM3810) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53299] VGAM3810 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3810 was detected is described hereinabove with reference to Figs. 2-8.

[53300] VGAM3810 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3810 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53301] VGAM3810 gene, herein designated VGAM GENE, encodes a VGAM3810 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3810 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3810 precursor RNA is designated SEQ ID:86489, and is provided hereinbelow with reference to the sequence listing part.

[53302] VGAM3810 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53303] An enzyme complex designated DICER COMPLEX, dices the VGAM3810 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3810 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3810 RNA is designated SEQ ID:86490, and is provided hereinbelow with reference to the sequence listing part.

[53304] VGAM3810 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3810 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3810 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53305] VGAM3810 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3810 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3810 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3810 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3810 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53306] The complementary binding of VGAM3810 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3810 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3810

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3810 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53307] It is appreciated that VGAM3810 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3810 host target genes. The mRNA of each one of this plurality of VGAM3810 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3810 RNA, herein designated VGAM RNA, and which when bound by VGAM3810 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3810 host target proteins.

[53308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3810 gene, herein designated VGAM GENE, on one or more VGAM3810 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53309] It is yet further appreciated that a function of VGAM3810 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3810 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3810 correlate with, and may be deduced from, the identity of the host target genes which VGAM3810 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53310] Nucleotide sequences of the VGAM3810 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3810 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3810 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3810 are further described hereinbelow with reference to Table 1.

[53311] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3810 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53312] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3811 (VGAM3811) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53313] VGAM3811 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3811 was detected is described hereinabove with reference to Figs. 2-8.

[53314] VGAM3811 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM3811 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[53315] VGAM3811 gene, herein designated VGAM GENE, encodes a VGAM3811 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3811 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3811 precursor RNA is designated SEQ ID:86492, and is provided hereinbelow with reference to the sequence listing part.

[53316] VGAM3811 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53317] An enzyme complex designated DICER COMPLEX, dices the VGAM3811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3811 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3811 RNA is designated SEQ ID:86493, and is provided hereinbelow with reference to the sequence listing part.

[53318] VGAM3811 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3811 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3811 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53319] VGAM3811 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3811 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3811 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3811 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3811 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53320] The complementary binding of VGAM3811 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3811 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3811 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3811 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53321] It is appreciated that VGAM3811 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3811 host target genes. The mRNA of each one of this plurality of VGAM3811 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3811 RNA, herein designated VGAM RNA, and which when bound by VGAM3811 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3811 host target proteins.

[53322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3811 gene, herein designated VGAM GENE, on one or more VGAM3811 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53323] It is yet further appreciated that a function of VGAM3811 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3811 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM3811 correlate with, and may be deduced from, the identity of the host target genes which VGAM3811 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53324] Nucleotide sequences of the VGAM3811 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3811 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3811 are further

described hereinbelow with reference to Table 1.

[53325] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3811 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53326] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3812 (VGAM3812) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53327] VGAM3812 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3812 was detected is described hereinabove with reference to Figs. 2-8.

[53328] VGAM3812 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM3812 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53329] VGAM3812 gene, herein designated VGAM GENE, encodes a VGAM3812 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3812 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3812 precursor RNA is designated SEQ ID:86530, and is provided hereinbelow with reference to the sequence listing part.

[53330] VGAM3812 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53331] An enzyme complex designated DICER COMPLEX, dices the VGAM3812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3812 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3812 RNA is designated SEQ ID:86531, and is provided hereinbelow with reference to the sequence listing part.

[53332] VGAM3812 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3812 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3812 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53333] VGAM3812 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3812 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3812 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3812 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3812 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53334] The complementary binding of VGAM3812 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3812 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3812 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3812 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53335] It is appreciated that VGAM3812 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3812 host target genes. The mRNA of each one of this plurality of VGAM3812 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3812 RNA, herein designated VGAM RNA, and which when bound by VGAM3812 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3812 host target proteins.

[53336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3812 gene, herein designated VGAM GENE, on one or more VGAM3812 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53337] It is yet further appreciated that a function of VGAM3812 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3812 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM3812 correlate with, and may be deduced from, the identity of the host target genes which VGAM3812 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53338] Nucleotide sequences of the VGAM3812 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3812 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3812 are further described hereinbelow with reference to Table 1.

[53339] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3812 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53340] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3813 (VGAM3813) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53341] VGAM3813 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3813 was detected is described hereinabove with reference to Figs. 2-8.

[53342] VGAM3813 gene, herein designated VGAM GENE, is a viral gene contained in the genome of West Nile virus. VGAM3813 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53343] VGAM3813 gene, herein designated VGAM GENE, encodes

a VGAM3813 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3813 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3813 precursor RNA is designated SEQ ID:86552, and is provided hereinbelow with reference to the sequence listing part.

[53344] VGAM3813 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53345] An enzyme complex designated DICER COMPLEX, dices the VGAM3813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3813 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3813 RNA is designated SEQ ID:86553, and is provided hereinbelow with reference to the sequence listing part.

[53346] VGAM3813 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3813 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3813 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53347] VGAM3813 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3813 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3813 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3813 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3813 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53348] The complementary binding of VGAM3813 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3813 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3813 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3813 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[53349] It is appreciated that VGAM3813 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3813 host target genes. The mRNA of each one of this plurality of VGAM3813 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3813 RNA, herein designated VGAM RNA, and which when bound by VGAM3813 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3813 host target proteins.

[53350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3813 gene, herein designated VGAM GENE, on one or more VGAM3813 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53351] It is yet further appreciated that a function of VGAM3813 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3813 include diagnosis, prevention and treatment of viral infection by West Nile virus. Specific functions, and accordingly utilities, of VGAM3813 correlate with, and may be deduced from, the identity of the host target genes which VGAM3813 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53352] Nucleotide sequences of the VGAM3813 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3813 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3813 are further described hereinbelow with reference to Table 1.

[53353] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3813 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53354] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3814 (VGAM3814) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53355] VGAM3814 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3814 was detected is described hereinabove with reference to Figs. 2-8.

[53356] VGAM3814 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3814 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53357] VGAM3814 gene, herein designated VGAM GENE, encodes a VGAM3814 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3814 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3814 precursor RNA is designated SEQ ID:86567, and is provided hereinbelow with reference to the sequence listing part.

[53358] VGAM3814 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53359] An enzyme complex designated DICER COMPLEX, dices the VGAM3814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3814 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3814 RNA is designated SEQ ID:86568, and is provided hereinbelow with reference to the sequence listing part.

[53360] VGAM3814 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3814 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3814 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53361] VGAM3814 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3814 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3814 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3814 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3814 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53362] The complementary binding of VGAM3814 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3814 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3814 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3814 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53363] It is appreciated that VGAM3814 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3814 host target genes. The mRNA of each one of this plurality of VGAM3814 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3814 RNA, herein designated VGAM RNA, and which when bound by VGAM3814 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3814 host target proteins.

[53364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3814 gene, herein designated VGAM GENE, on one or more VGAM3814 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53365] It is yet further appreciated that a function of VGAM3814 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3814 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3814 correlate with, and may be deduced from, the identity of the host target genes which VGAM3814 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53366] Nucleotide sequences of the VGAM3814 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3814 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3814 are further described hereinbelow with reference to Table 1.

[53367] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3814 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53368] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3815 (VGAM3815) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53369] VGAM3815 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3815 was detected is described hereinabove with reference to Figs. 2-8.

[53370] VGAM3815 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine adenovirus 7. VGAM3815 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53371] VGAM3815 gene, herein designated VGAM GENE, encodes a VGAM3815 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3815 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3815 precursor RNA is designated SEQ ID:86642, and is provided hereinbelow with reference to the sequence listing part.

[53372] VGAM3815 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53373] An enzyme complex designated DICER COMPLEX, dices the VGAM3815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3815 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3815 RNA is designated SEQ ID:86643, and is provided hereinbelow with reference to the sequence listing part.

[53374] VGAM3815 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3815 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3815 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53375] VGAM3815 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3815 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3815 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3815 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3815 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53376] The complementary binding of VGAM3815 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3815 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3815 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3815 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53377] It is appreciated that VGAM3815 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3815 host target genes. The mRNA of each one of this plurality of VGAM3815 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3815 RNA, herein designated VGAM RNA, and which when bound by VGAM3815 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3815 host target proteins.

[53378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3815 gene, herein designated VGAM GENE, on one or more VGAM3815 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53379] It is yet further appreciated that a function of VGAM3815 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3815 include diagnosis, prevention and treatment of viral infection by Ovine adenovirus 7. Specific functions, and accordingly utilities, of VGAM3815 correlate with, and may be deduced from, the identity of the host target genes which VGAM3815 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53380] Nucleotide sequences of the VGAM3815 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3815 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3815 are further described hereinbelow with reference to Table 1.

[53381] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3815 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53382] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3816 (VGAM3816) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53383] VGAM3816 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3816 was detected is described hereinabove with reference to Figs. 2–8.

[53384] VGAM3816 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murray Valley encephalitis virus. VGAM3816 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53385] VGAM3816 gene, herein designated VGAM GENE, encodes a VGAM3816 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3816 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3816 precursor RNA is designated SEQ ID:86661, and is provided hereinbelow with reference to the sequence listing part.

[53386] VGAM3816 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53387] An enzyme complex designated DICER COMPLEX, dices the VGAM3816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3816 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3816 RNA is designated SEQ ID:86662, and is provided hereinbelow with reference to the sequence listing part.

[53388] VGAM3816 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3816 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3816 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53389] VGAM3816 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3816 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3816 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3816 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3816 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53390] The complementary binding of VGAM3816 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3816 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3816 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3816 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53391] It is appreciated that VGAM3816 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3816 host target genes. The mRNA of each one of this plurality of VGAM3816 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3816 RNA, herein designated VGAM RNA, and which when bound by VGAM3816 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3816 host target proteins.

[53392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3816 gene, herein designated VGAM GENE, on one or more VGAM3816 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [53393] It is yet further appreciated that a function of VGAM3816 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3816 include diagnosis, prevention and treatment of viral infection by Murray Valley encephalitis virus. Specific functions, and accordingly utilities, of VGAM3816 correlate with, and may be deduced from, the identity of the host target genes which VGAM3816 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [53394] Nucleotide sequences of the VGAM3816 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3816 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3816 are further described hereinbelow with reference to Table 1.
- [53395] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3816 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53396] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3817 (VGAM3817) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53397] VGAM3817 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3817 was detected is described hereinabove with reference to Figs. 2-8.

[53398] VGAM3817 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM3817 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53399] VGAM3817 gene, herein designated VGAM GENE, encodes a VGAM3817 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3817 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3817 precursor RNA is designated SEQ ID:86667, and is provided hereinbelow with reference to the sequence listing part.

[53400] VGAM3817 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53401] An enzyme complex designated DICER COMPLEX, dices the VGAM3817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3817 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3817 RNA is designated SEQ ID:86668, and is provided hereinbelow with reference to the sequence listing part.

[53402] VGAM3817 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3817 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3817 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53403] VGAM3817 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3817 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3817 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3817 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3817 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53404] The complementary binding of VGAM3817 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3817 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3817 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3817 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53405] It is appreciated that VGAM3817 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3817 host target genes. The mRNA of

each one of this plurality of VGAM3817 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3817 RNA, herein designated VGAM RNA, and which when bound by VGAM3817 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3817 host target proteins.

[53406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3817 gene, herein designated VGAM GENE, on one or more VGAM3817 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[53407] It is yet further appreciated that a function of VGAM3817 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3817 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM3817 correlate with, and may be deduced from, the identity of the host target genes which VGAM3817 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53408] Nucleotide sequences of the VGAM3817 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3817 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3817 are further described hereinbelow with reference to Table 1.

[53409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3817 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[53410] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3818 (VGAM3818) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53411] VGAM3818 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3818 was detected is described hereinabove with reference to Figs. 2–8.

[53412] VGAM3818 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3818 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53413] VGAM3818 gene, herein designated VGAM GENE, encodes a VGAM3818 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3818 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3818 precursor RNA is designated SEQ ID:86674, and is provided hereinbelow with reference to the sequence listing part.

[53414] VGAM3818 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53415] An enzyme complex designated DICER COMPLEX, dices the VGAM3818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3818 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3818 RNA is designated SEQ ID:86675,

and is provided hereinbelow with reference to the sequence listing part.

[53416] VGAM3818 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3818 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3818 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53417] VGAM3818 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3818 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3818 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3818 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3818 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53418] The complementary binding of VGAM3818 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3818 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3818 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3818 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53419] It is appreciated that VGAM3818 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3818 host target genes. The mRNA of each one of this plurality of VGAM3818 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3818 RNA, herein designated VGAM RNA, and which when bound by VGAM3818 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3818 host target proteins.

[53420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3818 gene, herein designated VGAM GENE, on one or more VGAM3818 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53421] It is yet further appreciated that a function of VGAM3818 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3818 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3818 correlate with, and may be deduced from, the identity of the host target genes which VGAM3818 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53422] Nucleotide sequences of the VGAM3818 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3818 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3818 are further described hereinbelow with reference to Table 1.

[53423] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3818 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53424] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3819 (VGAM3819) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53425] VGAM3819 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3819 was detected is described hereinabove with reference to Figs. 2–8.

[53426] VGAM3819 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM3819 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53427] VGAM3819 gene, herein designated VGAM GENE, encodes a VGAM3819 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3819 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3819 precursor

sor RNA is designated SEQ ID:86681, and is provided hereinbelow with reference to the sequence listing part.

[53428] VGAM3819 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53429] An enzyme complex designated DICER COMPLEX, dices the VGAM3819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3819 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3819 RNA is designated SEQ ID:86682, and is provided hereinbelow with reference to the se-

quence listing part.

[53430] VGAM3819 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3819 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3819 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53431] VGAM3819 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3819 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3819 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3819 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3819 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53432] The complementary binding of VGAM3819 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3819 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3819 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3819 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53433] It is appreciated that VGAM3819 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3819 host target genes. The mRNA of each one of this plurality of VGAM3819 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3819 RNA, herein designated VGAM RNA, and which when bound by VGAM3819 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3819 host target proteins.

[53434] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3819 gene, herein designated VGAM GENE, on one or more VGAM3819 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53435] It is yet further appreciated that a function of VGAM3819

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3819 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3819 correlate with, and may be deduced from, the identity of the host target genes which VGAM3819 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53436] Nucleotide sequences of the VGAM3819 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3819 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3819 are further described hereinbelow with reference to Table 1.

[53437] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3819 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53438] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3820 (VGAM3820) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53439] VGAM3820 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3820 was detected is described hereinabove with reference to Figs. 2–8.

[53440] VGAM3820 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3820 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53441] VGAM3820 gene, herein designated VGAM GENE, encodes a VGAM3820 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3820 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3820 precursor RNA is designated SEQ ID:86690, and is provided

hereinbelow with reference to the sequence listing part.

[53442] VGAM3820 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53443] An enzyme complex designated DICER COMPLEX, dices the VGAM3820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3820 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3820 RNA is designated SEQ ID:86691, and is provided hereinbelow with reference to the sequence listing part.

[53444] VGAM3820 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3820 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3820 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53445] VGAM3820 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3820 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3820 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3820 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3820 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53446] The complementary binding of VGAM3820 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3820 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3820 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3820 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53447] It is appreciated that VGAM3820 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3820 host target genes. The mRNA of each one of this plurality of VGAM3820 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3820 RNA, herein designated VGAM RNA, and which when bound by VGAM3820 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3820 host target proteins.

[53448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3820 gene, herein designated VGAM GENE, on one or more VGAM3820 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53449] It is yet further appreciated that a function of VGAM3820 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3820 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3820 correlate with, and may be deduced from, the identity of the host target genes which VGAM3820 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53450] Nucleotide sequences of the VGAM3820 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3820 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3820 are further described hereinbelow with reference to Table 1.

[53451] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3820 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53452] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3821 (VGAM3821) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53453] VGAM3821 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3821 was detected is described hereinabove with reference to Figs. 2–8.

[53454] VGAM3821 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM3821 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53455] VGAM3821 gene, herein designated VGAM GENE, encodes a VGAM3821 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3821 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3821 precursor RNA is designated SEQ ID:86717, and is provided hereinbelow with reference to the sequence listing part.

[53456] VGAM3821 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53457] An enzyme complex designated DICER COMPLEX, dices the VGAM3821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3821 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3821 RNA is designated SEQ ID:86718, and is provided hereinbelow with reference to the sequence listing part.

[53458] VGAM3821 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3821 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3821 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53459] VGAM3821 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3821 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3821 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3821 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3821 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53460] The complementary binding of VGAM3821 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3821 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3821 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3821 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53461] It is appreciated that VGAM3821 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3821 host target genes. The mRNA of each one of this plurality of VGAM3821 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3821 RNA, herein designated VGAM

RNA, and which when bound by VGAM3821 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3821 host target proteins.

[53462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3821 gene, herein designated VGAM GENE, on one or more VGAM3821 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53463] It is yet further appreciated that a function of VGAM3821 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3821 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3821 correlate with, and may be deduced from, the identity of the host target genes which VGAM3821 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53464] Nucleotide sequences of the VGAM3821 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3821 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3821 are further described hereinbelow with reference to Table 1.

[53465] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3821 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53466] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3822 (VGAM3822) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53467] VGAM3822 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3822 was detected is described hereinabove with reference to Figs. 2-8.

[53468] VGAM3822 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3822 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53469] VGAM3822 gene, herein designated VGAM GENE, encodes a VGAM3822 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3822 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3822 precursor RNA is designated SEQ ID:86721, and is provided hereinbelow with reference to the sequence listing part.

[53470] VGAM3822 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53471] An enzyme complex designated DICER COMPLEX, dices the VGAM3822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3822 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3822 RNA is designated SEQ ID:86722, and is provided hereinbelow with reference to the sequence listing part.

[53472] VGAM3822 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3822 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3822 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53473] VGAM3822 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3822 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3822 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3822 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3822 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53474] The complementary binding of VGAM3822 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3822 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3822 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3822 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53475] It is appreciated that VGAM3822 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3822 host target genes. The mRNA of each one of this plurality of VGAM3822 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3822 RNA, herein designated VGAM RNA, and which when bound by VGAM3822 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3822 host target proteins.

[53476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3822 gene, herein designated VGAM GENE, on one or more VGAM3822 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53477] It is yet further appreciated that a function of VGAM3822 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3822 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3822 correlate with, and may be deduced from, the identity of the host target genes which VGAM3822 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53478] Nucleotide sequences of the VGAM3822 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3822 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3822 are further described hereinbelow with reference to Table 1.

[53479] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3822 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53480] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3823 (VGAM3823) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53481] VGAM3823 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3823 was detected is described hereinabove with reference to Figs. 2–8.

[53482] VGAM3823 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Influenza B virus. VGAM3823 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53483] VGAM3823 gene, herein designated VGAM GENE, encodes a VGAM3823 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3823 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3823 precursor RNA is designated SEQ ID:86726, and is provided hereinbelow with reference to the sequence listing part.

[53484] VGAM3823 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3823 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53485] An enzyme complex designated DICER COMPLEX, dices the VGAM3823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3823 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3823 RNA is designated SEQ ID:86727, and is provided hereinbelow with reference to the sequence listing part.

[53486] VGAM3823 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3823 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3823 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53487] VGAM3823 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3823 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3823 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3823 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3823 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53488] The complementary binding of VGAM3823 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3823 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3823 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3823 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53489] It is appreciated that VGAM3823 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3823 host target genes. The mRNA of each one of this plurality of VGAM3823 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3823 RNA, herein designated VGAM RNA, and which when bound by VGAM3823 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3823 host target proteins.

[53490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3823 gene, herein designated VGAM GENE, on one or more VGAM3823 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53491] It is yet further appreciated that a function of VGAM3823 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3823 include diagnosis, prevention and treatment of viral infection by Influenza B virus. Specific

functions, and accordingly utilities, of VGAM3823 correlate with, and may be deduced from, the identity of the host target genes which VGAM3823 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53492] Nucleotide sequences of the VGAM3823 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3823 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3823 are further described hereinbelow with reference to Table 1.

[53493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3823 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53494] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3824 (VGAM3824) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[53495] VGAM3824 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3824 was detected is described hereinabove with reference to Figs. 2–8.

[53496] VGAM3824 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM3824 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53497] VGAM3824 gene, herein designated VGAM GENE, encodes a VGAM3824 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3824 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3824 precursor RNA is designated SEQ ID:86754, and is provided hereinbelow with reference to the sequence listing part.

[53498] VGAM3824 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3824 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53499] An enzyme complex designated DICER COMPLEX, dices the VGAM3824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3824 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3824 RNA is designated SEQ ID:86755, and is provided hereinbelow with reference to the sequence listing part.

[53500] VGAM3824 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3824 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3824 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53501] VGAM3824 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3824 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3824 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3824 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3824 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53502] The complementary binding of VGAM3824 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3824 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3824 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3824 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53503] It is appreciated that VGAM3824 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3824 host target genes. The mRNA of each one of this plurality of VGAM3824 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3824 RNA, herein designated VGAM RNA, and which when bound by VGAM3824 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3824 host target proteins.

[53504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3824 gene, herein designated VGAM GENE, on one or more VGAM3824 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53505] It is yet further appreciated that a function of VGAM3824 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3824 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3824 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM3824 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53506] Nucleotide sequences of the VGAM3824 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3824 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3824 are further described hereinbelow with reference to Table 1.

[53507] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3824 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53508] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3825 (VGAM3825) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[53509] VGAM3825 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3825 was detected is described hereinabove with reference to Figs. 2–8.

[53510] VGAM3825 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3825 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53511] VGAM3825 gene, herein designated VGAM GENE, encodes a VGAM3825 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3825 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3825 precursor RNA is designated SEQ ID:86762, and is provided hereinbelow with reference to the sequence listing part.

[53512] VGAM3825 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53513] An enzyme complex designated DICER COMPLEX, dices the VGAM3825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3825 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3825 RNA is designated SEQ ID:86763, and is provided hereinbelow with reference to the sequence listing part.

[53514] VGAM3825 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3825 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3825 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53515] VGAM3825 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3825 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3825 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3825 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3825 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53516] The complementary binding of VGAM3825 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3825 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3825 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3825 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53517] It is appreciated that VGAM3825 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3825 host target genes. The mRNA of each one of this plurality of VGAM3825 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3825 RNA, herein designated VGAM RNA, and which when bound by VGAM3825 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3825 host target proteins.

[53518] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3825 gene, herein designated VGAM GENE, on one or more VGAM3825 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53519] It is yet further appreciated that a function of VGAM3825 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3825 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3825 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3825 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53520] Nucleotide sequences of the VGAM3825 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3825 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3825 are further described hereinbelow with reference to Table 1.

[53521] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3825 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53522] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3826 (VGAM3826) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53523] VGAM3826 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3826 was detected is described hereinabove with reference to Figs. 2–8.

[53524] VGAM3826 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3826 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53525] VGAM3826 gene, herein designated VGAM GENE, encodes a VGAM3826 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3826 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3826 precursor RNA is designated SEQ ID:86778, and is provided hereinbelow with reference to the sequence listing part.

[53526] VGAM3826 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53527] An enzyme complex designated DICER COMPLEX, dices the VGAM3826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3826 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3826 RNA is designated SEQ ID:86779, and is provided hereinbelow with reference to the sequence listing part.

[53528] VGAM3826 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3826 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3826 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53529] VGAM3826 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3826 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3826 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3826 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3826 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53530] The complementary binding of VGAM3826 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3826 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3826 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3826 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53531] It is appreciated that VGAM3826 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3826 host target genes. The mRNA of each one of this plurality of VGAM3826 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3826 RNA, herein designated VGAM RNA, and which when bound by VGAM3826 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3826 host target proteins.

[53532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3826 gene, herein designated VGAM GENE, on one or more VGAM3826 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53533] It is yet further appreciated that a function of VGAM3826 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3826 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3826 correlate with, and may be deduced from, the identity of the host target genes which VGAM3826 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[53534] Nucleotide sequences of the VGAM3826 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3826 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3826 are further described hereinbelow with reference to Table 1.

[53535] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3826 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53536] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3827 (VGAM3827) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53537] VGAM3827 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3827 was detected is described hereinabove with reference to Figs. 2–8.

[53538] VGAM3827 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3827 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53539] VGAM3827 gene, herein designated VGAM GENE, encodes a VGAM3827 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3827 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3827 precursor RNA is designated SEQ ID:86819, and is provided hereinbelow with reference to the sequence listing part.

[53540] VGAM3827 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53541] An enzyme complex designated DICER COMPLEX, dices the VGAM3827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3827 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3827 RNA is designated SEQ ID:86820, and is provided hereinbelow with reference to the sequence listing part.

[53542] VGAM3827 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3827 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3827 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53543] VGAM3827 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3827 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3827 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3827 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3827 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[53544] The complementary binding of VGAM3827 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3827 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3827 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3827 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53545] It is appreciated that VGAM3827 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3827 host target genes. The mRNA of each one of this plurality of VGAM3827 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3827 RNA, herein designated VGAM RNA, and which when bound by VGAM3827 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3827 host target proteins.

[53546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3827 gene, herein designated VGAM GENE, on one or more VGAM3827 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53547] It is yet further appreciated that a function of VGAM3827 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3827 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3827 correlate with, and may be deduced from, the identity of the host target genes which VGAM3827 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[53548] Nucleotide sequences of the VGAM3827 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3827 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3827 are further described hereinbelow with reference to Table 1.

[53549] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3827 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53550] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3828 (VGAM3828) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53551] VGAM3828 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3828 was detected is described hereinabove with reference to Figs. 2–8.

[53552] VGAM3828 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM3828 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53553] VGAM3828 gene, herein designated VGAM GENE, encodes a VGAM3828 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3828 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3828 precursor RNA is designated SEQ ID:86838, and is provided hereinbelow with reference to the sequence listing part.

[53554] VGAM3828 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53555] An enzyme complex designated DICER COMPLEX, dices the VGAM3828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3828 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3828 RNA is designated SEQ ID:86839, and is provided hereinbelow with reference to the sequence listing part.

[53556] VGAM3828 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3828 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3828 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[53557] VGAM3828 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3828 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3828 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3828 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3828 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53558] The complementary binding of VGAM3828 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3828 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3828 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3828 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53559] It is appreciated that VGAM3828 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3828 host target genes. The mRNA of each one of this plurality of VGAM3828 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3828 RNA, herein designated VGAM RNA, and which when bound by VGAM3828 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3828 host target proteins.

[53560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3828 gene, herein designated VGAM GENE, on one

or more VGAM3828 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53561] It is yet further appreciated that a function of VGAM3828 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3828 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3828 correlate with, and may be deduced from, the identity of the host target genes which VGAM3828 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53562] Nucleotide sequences of the VGAM3828 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3828 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3828 are further described hereinbelow with reference to Table 1.

[53563] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3828 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53564] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3829 (VGAM3829) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53565] VGAM3829 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3829 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[53566] VGAM3829 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3829 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53567] VGAM3829 gene, herein designated VGAM GENE, encodes a VGAM3829 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3829 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3829 precursor RNA is designated SEQ ID:86847, and is provided hereinbelow with reference to the sequence listing part.

[53568] VGAM3829 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53569] An enzyme complex designated DICER COMPLEX, dices the VGAM3829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3829 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3829 RNA is designated SEQ ID:86848, and is provided hereinbelow with reference to the sequence listing part.

[53570] VGAM3829 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3829 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3829 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[53571] VGAM3829 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3829 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3829 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3829 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3829 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[53572] The complementary binding of VGAM3829 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3829 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3829 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3829 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53573] It is appreciated that VGAM3829 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3829 host target genes. The mRNA of each one of this plurality of VGAM3829 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3829 RNA, herein designated VGAM RNA, and which when bound by VGAM3829 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3829 host target proteins.

[53574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3829 gene, herein designated VGAM GENE, on one or more VGAM3829 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[53575] It is yet further appreciated that a function of VGAM3829 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3829 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3829 correlate with, and may be deduced from, the identity of the host target genes which VGAM3829 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53576] Nucleotide sequences of the VGAM3829 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3829 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3829 are further described hereinbelow with reference to Table 1.

[53577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3829 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53578] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3830(VGR3830) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53579] VGR3830 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3830 gene was

detected is described hereinabove with reference to Figs. 6–15.

[53580] VGR3830 gene encodes VGR3830 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53581] VGR3830 precursor RNA folds spatially, forming VGR3830 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3830 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3830 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed–reversed sequence of the second half thereof, as is well known in the art.

[53582] VGR3830 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM2410 precursor RNA, VGAM2411 precursor RNA, VGAM3407 precursor RNA and VGAM3592 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRE-

CURSOR and VGAM4 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53583] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM2410 RNA, VGAM2411 RNA, VGAM3407 RNA and VGAM3592 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA and VGAM4 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53584] VGAM2410 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM2410 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2410 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM2410 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of

Fig. 1.

[53585] VGAM2411 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM2411 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2411 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM2411 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53586] VGAM3407 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM3407 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3407 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM3407 host target protein, herein schematically

represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53587] VGAM3592 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM3592 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3592 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM3592 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53588] It is appreciated that a function of VGR3830 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3830 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3830 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in

the operon-like cluster of VGR3830 gene: VGAM2410 host target protein, VGAM2411 host target protein, VGAM3407 host target protein and VGAM3592 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM2410, VGAM2411, VGAM3407 and VGAM3592

[53589] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3831(VGR3831) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53590] VGR3831 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3831 gene was detected is described hereinabove with reference to Figs. 6–15.

[53591] VGR3831 gene encodes VGR3831 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typi-

cally several hundred nucleotides long.

[53592] VGR3831 precursor RNA folds spatially, forming VGR3831 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3831 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3831 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53593] VGR3831 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM473 precursor RNA and VGAM474 precursor RNA, herein schematically represented by VGAM1 PRECURSOR and VGAM2 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53594] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA

segments of about 22 nucleotides in length, VGAM473 RNA and VGAM474 RNA respectively, herein schematically represented by VGAM1 RNA and VGAM2 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53595] VGAM473 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM473 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM473 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM473 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53596] VGAM474 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM474 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM474 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM474 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53597] It is appreciated that a function of VGR3831 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3831 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3831 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3831 gene: VGAM473 host target protein and VGAM474 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN and VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM473 and VGAM474

[53598] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred

to here as Viral Genomic Record 3832(VGR3832) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53599] VGR3832 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3832 gene was detected is described hereinabove with reference to Figs. 6-15.

[53600] VGR3832 gene encodes VGR3832 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53601] VGR3832 precursor RNA folds spatially, forming VGR3832 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3832 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3832 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which

is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53602] VGR3832 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM1012 precursor RNA, VGAM1013 precursor RNA and VGAM3205 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR and VGAM3 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53603] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM1012 RNA, VGAM1013 RNA and VGAM3205 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA and VGAM3 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53604] VGAM1012 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM1012 host target RNA, herein schematically represented by VGAM1

HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1012 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM1012 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53605] VGAM1013 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM1013 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1013 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM1013 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53606] VGAM3205 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM3205 host

target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3205 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM3205 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53607] It is appreciated that a function of VGR3832 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3832 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3832 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3832 gene: VGAM1012 host target protein, VGAM1013 host target protein and VGAM3205 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function

of these host target genes is elaborated hereinabove with reference to VGAM1012, VGAM1013 and VGAM3205

[53608] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3833(VGR3833) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53609] VGR3833 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3833 gene was detected is described hereinabove with reference to Figs. 6–15.

[53610] VGR3833 gene encodes VGR3833 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53611] VGR3833 precursor RNA folds spatially, forming VGR3833 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3833 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art

as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3833 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53612] VGR3833 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM485 precursor RNA, VGAM486 precursor RNA, VGAM488 precursor RNA, VGAM489 precursor RNA, VGAM490 precursor RNA, VGAM616 precursor RNA, VGAM617 precursor RNA and VGAM619 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53613] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM485

RNA, VGAM486 RNA, VGAM488 RNA, VGAM489 RNA, VGAM490 RNA, VGAM616 RNA, VGAM617 RNA and VGAM619 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53614] VGAM485 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM485 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM485 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM485 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53615] VGAM486 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM486 host target RNA, herein schematically represented by VGAM2

HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM486 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM486 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53616] VGAM488 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM488 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM488 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM488 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53617] VGAM489 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM489 host

target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM489 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM489 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53618] VGAM490 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM490 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM490 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM490 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53619] VGAM616 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding

site located in an untranslated region of VGAM616 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM616 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM616 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53620] VGAM617 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM617 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM617 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM617 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53621] VGAM619 RNA, herein schematically represented by

VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM619 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM619 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM619 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53622] It is appreciated that a function of VGR3833 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3833 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3833 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3833 gene: VGAM485 host target protein, VGAM486 host target protein, VGAM488 host target protein, VGAM489 host target protein,

VGAM490 host target protein, VGAM616 host target protein, VGAM617 host target protein and VGAM619 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM485, VGAM486, VGAM488, VGAM489, VGAM490, VGAM616, VGAM617 and VGAM619

[53623] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3834(VGR3834) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53624] VGR3834 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3834 gene was detected is described hereinabove with reference to Figs. 6-15.

[53625] VGR3834 gene encodes VGR3834 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typi-

cally several hundred nucleotides long.

[53626] VGR3834 precursor RNA folds spatially, forming VGR3834 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3834 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3834 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53627] VGR3834 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM620 precursor RNA, VGAM621 precursor RNA, VGAM785 precursor RNA, VGAM936 precursor RNA, VGAM1004 precursor RNA, VGAM1005 precursor RNA, VGAM1006 precursor RNA and VGAM1007 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR re-

spectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53628] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM620 RNA, VGAM621 RNA, VGAM785 RNA, VGAM936 RNA, VGAM1004 RNA, VGAM1005 RNA, VGAM1006 RNA and VGAM1007 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53629] VGAM620 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM620 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM620 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM620 host target protein, herein schematically

represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53630] VGAM621 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM621 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM621 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM621 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53631] VGAM785 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM785 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM785 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA

into VGAM785 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53632] VGAM936 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM936 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM936 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM936 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53633] VGAM1004 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM1004 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1004 host target RNA, herein

schematically represented by VGAM5 HOST TARGET RNA into VGAM1004 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53634] VGAM1005 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM1005 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1005 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM1005 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53635] VGAM1006 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM1006 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby in-

hibiting translation of VGAM1006 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM1006 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53636] VGAM1007 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM1007 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1007 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM1007 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53637] It is appreciated that a function of VGR3834 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3834 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3834

gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3834 gene: VGAM620 host target protein, VGAM621 host target protein, VGAM785 host target protein, VGAM936 host target protein, VGAM1004 host target protein, VGAM1005 host target protein, VGAM1006 host target protein and VGAM1007 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM620, VGAM621, VGAM785, VGAM936, VGAM1004, VGAM1005, VGAM1006 and VGAM1007

[53638] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3835(VGR3835) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53639] VGR3835 gene, herein designated VGR GENE, is a novel

bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3835 gene was detected is described hereinabove with reference to Figs. 6–15.

[53640] VGR3835 gene encodes VGR3835 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53641] VGR3835 precursor RNA folds spatially, forming VGR3835 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3835 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3835 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed–reversed sequence of the second half thereof, as is well known in the art.

[53642] VGR3835 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM1150 precursor RNA, VGAM1311 precursor RNA, VGAM1312 precursor RNA, VGAM1521 pre–

cursor RNA, VGAM1522 precursor RNA, VGAM1533 precursor RNA, VGAM1537 precursor RNA and VGAM1541 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53643] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM1150 RNA, VGAM1311 RNA, VGAM1312 RNA, VGAM1521 RNA, VGAM1522 RNA, VGAM1533 RNA, VGAM1537 RNA and VGAM1541 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53644] VGAM1150 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM1150 host target RNA, herein schematically represented by VGAM1

HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1150 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM1150 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53645] VGAM1311 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM1311 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1311 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM1311 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53646] VGAM1312 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM1312 host

target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1312 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM1312 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53647] VGAM1521 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM1521 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1521 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM1521 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53648] VGAM1522 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding

site located in an untranslated region of VGAM1522 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1522 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM1522 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53649] VGAM1533 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM1533 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1533 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM1533 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53650] VGAM1537 RNA, herein schematically represented by

VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM1537 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1537 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM1537 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53651] VGAM1541 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM1541 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1541 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM1541 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53652] It is appreciated that a function of VGR3835 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3835 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3835 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3835 gene: VGAM1150 host target protein, VGAM1311 host target protein, VGAM1312 host target protein, VGAM1521 host target protein, VGAM1522 host target protein, VGAM1533 host target protein, VGAM1537 host target protein and VGAM1541 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM1150, VGAM1311, VGAM1312, VGAM1521, VGAM1522, VGAM1533, VGAM1537 and VGAM1541

[53653] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred

to here as Viral Genomic Record 3836(VGR3836) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53654] VGR3836 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3836 gene was detected is described hereinabove with reference to Figs. 6–15.

[53655] VGR3836 gene encodes VGR3836 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53656] VGR3836 precursor RNA folds spatially, forming VGR3836 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3836 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3836 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which

is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53657] VGR3836 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM1542 precursor RNA, VGAM1543 precursor RNA, VGAM2084 precursor RNA, VGAM2359 precursor RNA, VGAM2501 precursor RNA, VGAM2675 precursor RNA, VGAM2693 precursor RNA and VGAM2694 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53658] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM1542 RNA, VGAM1543 RNA, VGAM2084 RNA, VGAM2359 RNA, VGAM2501 RNA, VGAM2675 RNA, VGAM2693 RNA and VGAM2694 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4

RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53659] VGAM1542 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM1542 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1542 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM1542 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53660] VGAM1543 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM1543 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1543 host target RNA, herein

schematically represented by VGAM2 HOST TARGET RNA into VGAM1543 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53661] VGAM2084 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM2084 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2084 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM2084 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53662] VGAM2359 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM2359 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby in-

hibiting translation of VGAM2359 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM2359 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53663] VGAM2501 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM2501 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2501 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM2501 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53664] VGAM2675 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM2675 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2675 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM2675 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53665] VGAM2693 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM2693 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2693 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM2693 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53666] VGAM2694 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM2694 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corre-

sponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2694 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM2694 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53667] It is appreciated that a function of VGR3836 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3836 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3836 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3836 gene: VGAM1542 host target protein, VGAM1543 host target protein, VGAM2084 host target protein, VGAM2359 host target protein, VGAM2501 host target protein, VGAM2675 host target protein, VGAM2693 host target protein and VGAM2694 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through

VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM1542, VGAM1543, VGAM2084, VGAM2359, VGAM2501, VGAM2675, VGAM2693 and VGAM2694

[53668] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3837(VGR3837) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53669] VGR3837 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3837 gene was detected is described hereinabove with reference to Figs. 6–15.

[53670] VGR3837 gene encodes VGR3837 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53671] VGR3837 precursor RNA folds spatially, forming VGR3837 folded precursor RNA, herein designated VGR FOLDED

PRECURSOR RNA. It is appreciated that VGR3837 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3837 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53672] VGR3837 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM2695 precursor RNA, VGAM2744 precursor RNA, VGAM2833 precursor RNA, VGAM3040 precursor RNA, VGAM3080 precursor RNA, VGAM3115 precursor RNA, VGAM3155 precursor RNA and VGAM3167 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53673] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM2695 RNA, VGAM2744 RNA, VGAM2833 RNA, VGAM3040 RNA, VGAM3080 RNA, VGAM3115 RNA, VGAM3155 RNA and VGAM3167 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53674] VGAM2695 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM2695 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2695 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM2695 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53675] VGAM2744 RNA, herein schematically represented by

VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM2744 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2744 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM2744 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53676] VGAM2833 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM2833 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2833 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM2833 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53677] VGAM3040 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM3040 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3040 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM3040 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53678] VGAM3080 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM3080 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3080 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM3080 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of

Fig. 1.

[53679] VGAM3115 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM3115 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3115 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM3115 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53680] VGAM3155 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM3155 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3155 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM3155 host target protein, herein schematically

represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53681] VGAM3167 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM3167 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3167 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM3167 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53682] It is appreciated that a function of VGR3837 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3837 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3837 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in

the operon-like cluster of VGR3837 gene: VGAM2695 host target protein, VGAM2744 host target protein, VGAM2833 host target protein, VGAM3040 host target protein, VGAM3080 host target protein, VGAM3115 host target protein, VGAM3155 host target protein and VGAM3167 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM2695, VGAM2744, VGAM2833, VGAM3040, VGAM3080, VGAM3115, VGAM3155 and VGAM3167

[53683] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3838(VGR3838) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53684] VGR3838 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3838 gene was

detected is described hereinabove with reference to Figs. 6–15.

[53685] VGR3838 gene encodes VGR3838 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53686] VGR3838 precursor RNA folds spatially, forming VGR3838 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3838 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3838 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed–reversed sequence of the second half thereof, as is well known in the art.

[53687] VGR3838 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM3191 precursor RNA, VGAM3458 precursor RNA, VGAM3551 precursor RNA, VGAM3591 precursor RNA, VGAM3615 precursor RNA, VGAM3679 precursor RNA, VGAM3698 precursor RNA and VGAM3730

precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53688] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM3191 RNA, VGAM3458 RNA, VGAM3551 RNA, VGAM3591 RNA, VGAM3615 RNA, VGAM3679 RNA, VGAM3698 RNA and VGAM3730 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53689] VGAM3191 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM3191 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3191 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM3191 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53690] VGAM3458 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM3458 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3458 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM3458 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53691] VGAM3551 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM3551 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corre-

sponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3551 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM3551 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53692] VGAM3591 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM3591 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3591 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM3591 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53693] VGAM3615 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM3615 host target RNA, herein schematically represented by VGAM5

HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3615 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM3615 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53694] VGAM3679 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM3679 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3679 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM3679 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53695] VGAM3698 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM3698 host

target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3698 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM3698 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53696] VGAM3730 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM3730 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3730 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM3730 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53697] It is appreciated that a function of VGR3838 gene, herein designated VGR GENE, is inhibition of expression of host

target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3838 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3838 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3838 gene: VGAM3191 host target protein, VGAM3458 host target protein, VGAM3551 host target protein, VGAM3591 host target protein, VGAM3615 host target protein, VGAM3679 host target protein, VGAM3698 host target protein and VGAM3730 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM3191, VGAM3458, VGAM3551, VGAM3591, VGAM3615, VGAM3679, VGAM3698 and VGAM3730

[53698] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3839(VGR3839) viral gene, which encodes an operon-like cluster of novel viral

micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53699] VGR3839 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3839 gene was detected is described hereinabove with reference to Figs. 6–15.

[53700] VGR3839 gene encodes VGR3839 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53701] VGR3839 precursor RNA folds spatially, forming VGR3839 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3839 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3839 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed–reversed sequence of the second half thereof, as is well known in the art.

[53702] VGR3839 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM3733 precursor RNA, VGAM3754 precursor RNA and VGAM3827 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR and VGAM3 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53703] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM3733 RNA, VGAM3754 RNA and VGAM3827 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA and VGAM3 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53704] VGAM3733 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM3733 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3733 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM3733 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53705] VGAM3754 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM3754 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3754 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM3754 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53706] VGAM3827 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM3827 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corre-

sponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3827 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM3827 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53707] It is appreciated that a function of VGR3839 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3839 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3839 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3839 gene: VGAM3733 host target protein, VGAM3754 host target protein and VGAM3827 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM3733, VGAM3754 and VGAM3827

[53708] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3840(VGR3840) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53709] VGR3840 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3840 gene was detected is described hereinabove with reference to Figs. 6–15.

[53710] VGR3840 gene encodes VGR3840 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53711] VGR3840 precursor RNA folds spatially, forming VGR3840 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3840 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3840 precu-

sor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53712] VGR3840 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM2047 precursor RNA, VGAM2048 precursor RNA and VGAM3412 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR and VGAM3 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53713] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM2047 RNA, VGAM2048 RNA and VGAM3412 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA and VGAM3 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53714] VGAM2047 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding

site located in an untranslated region of VGAM2047 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2047 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM2047 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53715] VGAM2048 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM2048 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2048 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM2048 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53716] VGAM3412 RNA, herein schematically represented by

VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM3412 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3412 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM3412 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53717] It is appreciated that a function of VGR3840 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3840 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3840 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3840 gene: VGAM2047 host target protein, VGAM2048 host target protein and VGAM3412 host target protein, herein schematically rep-

resented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM2047, VGAM2048 and VGAM3412

[53718] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3841(VGR3841) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53719] VGR3841 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3841 gene was detected is described hereinabove with reference to Figs. 6–15.

[53720] VGR3841 gene encodes VGR3841 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53721] VGR3841 precursor RNA folds spatially, forming VGR3841 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3841 folded

precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3841 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53722] VGR3841 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM19 precursor RNA, VGAM20 precursor RNA, VGAM25 precursor RNA, VGAM26 precursor RNA, VGAM30 precursor RNA, VGAM31 precursor RNA, VGAM34 precursor RNA and VGAM35 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53723] The above mentioned VGAM precursor RNAs are diced by

DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM19 RNA, VGAM20 RNA, VGAM25 RNA, VGAM26 RNA, VGAM30 RNA, VGAM31 RNA, VGAM34 RNA and VGAM35 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53724] VGAM19 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM19 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM19 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM19 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53725] VGAM20 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding

site located in an untranslated region of VGAM20 host target RNA, herein schematically represented by VGAM20 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM20 host target RNA, herein schematically represented by VGAM20 HOST TARGET RNA into VGAM20 host target protein, herein schematically represented by VGAM20 HOST TARGET PROTEIN, both of Fig. 1.

[53726] VGAM25 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM25 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM25 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM25 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53727] VGAM26 RNA, herein schematically represented by

VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM26 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM26 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM26 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53728] VGAM30 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM30 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM30 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM30 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53729] VGAM31 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM31 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM31 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM31 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53730] VGAM34 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM34 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM34 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM34 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of

Fig. 1.

[53731] VGAM35 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM35 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM35 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM35 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53732] It is appreciated that a function of VGR3841 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3841 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3841 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3841 gene: VGAM19 host

target protein, VGAM20 host target protein, VGAM25 host target protein, VGAM26 host target protein, VGAM30 host target protein, VGAM31 host target protein, VGAM34 host target protein and VGAM35 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM19, VGAM20, VGAM25, VGAM26, VGAM30, VGAM31, VGAM34 and VGAM35

[53733] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3842(VGR3842) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53734] VGR3842 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3842 gene was detected is described hereinabove with reference to Figs. 6-15.

[53735] VGR3842 gene encodes VGR3842 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53736] VGR3842 precursor RNA folds spatially, forming VGR3842 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3842 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3842 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53737] VGR3842 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM37 precursor RNA, VGAM38 precursor RNA, VGAM39 precursor RNA, VGAM42 precursor RNA, VGAM44 precursor RNA, VGAM47 precursor RNA, VGAM49 precursor RNA and VGAM50 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRE-

CURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53738] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM37 RNA, VGAM38 RNA, VGAM39 RNA, VGAM42 RNA, VGAM44 RNA, VGAM47 RNA, VGAM49 RNA and VGAM50 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53739] VGAM37 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM37 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM37 host target RNA, herein

schematically represented by VGAM1 HOST TARGET RNA into VGAM37 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53740] VGAM38 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM38 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM38 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM38 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53741] VGAM39 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM39 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby in-

hibiting translation of VGAM39 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM39 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53742] VGAM42 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM42 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM42 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM42 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53743] VGAM44 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM44 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM44 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM44 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53744] VGAM47 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM47 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM47 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM47 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53745] VGAM49 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM49 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corre-

sponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM49 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM49 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53746] VGAM50 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM50 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM50 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM50 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53747] It is appreciated that a function of VGR3842 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3842 gene include

diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3842 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3842 gene: VGAM37 host target protein, VGAM38 host target protein, VGAM39 host target protein, VGAM42 host target protein, VGAM44 host target protein, VGAM47 host target protein, VGAM49 host target protein and VGAM50 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM37, VGAM38, VGAM39, VGAM42, VGAM44, VGAM47, VGAM49 and VGAM50

[53748] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3843(VGR3843) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known

in the art.

[53749] VGR3843 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3843 gene was detected is described hereinabove with reference to Figs. 6–15.

[53750] VGR3843 gene encodes VGR3843 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53751] VGR3843 precursor RNA folds spatially, forming VGR3843 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3843 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3843 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed–reversed sequence of the second half thereof, as is well known in the art.

[53752] VGR3843 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM pre–

cursor RNAs, VGAM52 precursor RNA, VGAM56 precursor RNA, VGAM60 precursor RNA, VGAM63 precursor RNA, VGAM66 precursor RNA, VGAM115 precursor RNA, VGAM117 precursor RNA and VGAM118 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53753] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM52 RNA, VGAM56 RNA, VGAM60 RNA, VGAM63 RNA, VGAM66 RNA, VGAM115 RNA, VGAM117 RNA and VGAM118 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53754] VGAM52 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding

site located in an untranslated region of VGAM52 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM52 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM52 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53755] VGAM56 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM56 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM56 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM56 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53756] VGAM60 RNA, herein schematically represented by

VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM60 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM60 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM60 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53757] VGAM63 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM63 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM63 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM63 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53758] VGAM66 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM66 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM66 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM66 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53759] VGAM115 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM115 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM115 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM115 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of

Fig. 1.

[53760] VGAM117 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM117 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM117 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM117 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53761] VGAM118 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM118 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM118 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM118 host target protein, herein schematically

represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53762] It is appreciated that a function of VGR3843 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3843 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3843 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3843 gene: VGAM52 host target protein, VGAM56 host target protein, VGAM60 host target protein, VGAM63 host target protein, VGAM66 host target protein, VGAM115 host target protein, VGAM117 host target protein and VGAM118 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM52, VGAM56, VGAM60, VGAM63, VGAM66, VGAM115, VGAM117 and VGAM118

[53763] Fig. 9 further provides a conceptual description of novel

bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3844(VGR3844) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53764] VGR3844 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3844 gene was detected is described hereinabove with reference to Figs. 6–15.

[53765] VGR3844 gene encodes VGR3844 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53766] VGR3844 precursor RNA folds spatially, forming VGR3844 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3844 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3844 precursor RNA comprises a plurality of segments, the first half

of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53767] VGR3844 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM121 precursor RNA, VGAM125 precursor RNA, VGAM129 precursor RNA, VGAM134 precursor RNA, VGAM139 precursor RNA, VGAM146 precursor RNA, VGAM367 precursor RNA and VGAM665 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53768] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM121 RNA, VGAM125 RNA, VGAM129 RNA, VGAM134 RNA, VGAM139 RNA, VGAM146 RNA, VGAM367 RNA and VGAM665 RNA respectively, herein schematically repre-

sented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53769] VGAM121 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM121 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM121 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM121 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53770] VGAM125 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM125 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby in-

hibiting translation of VGAM125 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM125 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53771] VGAM129 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM129 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM129 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM129 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53772] VGAM134 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM134 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM134 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM134 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53773] VGAM139 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM139 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM139 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM139 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53774] VGAM146 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM146 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corre-

sponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM146 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM146 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53775] VGAM367 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM367 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM367 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM367 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53776] VGAM665 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM665 host target RNA, herein schematically represented by VGAM8

HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM665 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM665 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53777] It is appreciated that a function of VGR3844 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3844 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3844 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3844 gene: VGAM121 host target protein, VGAM125 host target protein, VGAM129 host target protein, VGAM134 host target protein, VGAM139 host target protein, VGAM146 host target protein, VGAM367 host target protein and VGAM665 host target protein, herein schematically represented by

VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM121, VGAM125, VGAM129, VGAM134, VGAM139, VGAM146, VGAM367 and VGAM665

[53778] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3845(VGR3845) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53779] VGR3845 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3845 gene was detected is described hereinabove with reference to Figs. 6-15.

[53780] VGR3845 gene encodes VGR3845 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53781] VGR3845 precursor RNA folds spatially, forming VGR3845 folded precursor RNA, herein designated VGR FOLDED

PRECURSOR RNA. It is appreciated that VGR3845 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3845 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53782] VGR3845 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM666 precursor RNA, VGAM1465 precursor RNA, VGAM1467 precursor RNA, VGAM1518 precursor RNA, VGAM1664 precursor RNA, VGAM1665 precursor RNA, VGAM1667 precursor RNA and VGAM1721 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53783] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM666 RNA, VGAM1465 RNA, VGAM1467 RNA, VGAM1518 RNA, VGAM1664 RNA, VGAM1665 RNA, VGAM1667 RNA and VGAM1721 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53784] VGAM666 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM666 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM666 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM666 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53785] VGAM1465 RNA, herein schematically represented by

VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM1465 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1465 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM1465 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53786] VGAM1467 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM1467 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1467 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM1467 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53787] VGAM1518 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM1518 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1518 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM1518 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53788] VGAM1664 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM1664 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1664 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM1664 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of

Fig. 1.

[53789] VGAM1665 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM1665 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1665 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM1665 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53790] VGAM1667 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM1667 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1667 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM1667 host target protein, herein schematically

represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53791] VGAM1721 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM1721 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1721 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM1721 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53792] It is appreciated that a function of VGR3845 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3845 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3845 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in

the operon-like cluster of VGR3845 gene: VGAM666 host target protein, VGAM1465 host target protein, VGAM1467 host target protein, VGAM1518 host target protein, VGAM1664 host target protein, VGAM1665 host target protein, VGAM1667 host target protein and VGAM1721 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM666, VGAM1465, VGAM1467, VGAM1518, VGAM1664, VGAM1665, VGAM1667 and VGAM1721

[53793] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3846(VGR3846) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53794] VGR3846 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3846 gene was detected is described hereinabove with reference to Figs.

6-15.

[53795] VGR3846 gene encodes VGR3846 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53796] VGR3846 precursor RNA folds spatially, forming VGR3846 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3846 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3846 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53797] VGR3846 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM1723 precursor RNA, VGAM1864 precursor RNA, VGAM2018 precursor RNA, VGAM2061 precursor RNA, VGAM2114 precursor RNA, VGAM2320 precursor RNA, VGAM2327 precursor RNA and VGAM2532 precursor RNA, herein schematically represented by

VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53798] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM1723 RNA, VGAM1864 RNA, VGAM2018 RNA, VGAM2061 RNA, VGAM2114 RNA, VGAM2320 RNA, VGAM2327 RNA and VGAM2532 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53799] VGAM1723 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM1723 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby in-

hibiting translation of VGAM1723 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM1723 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53800] VGAM1864 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM1864 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1864 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM1864 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53801] VGAM2018 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM2018 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2018 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM2018 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53802] VGAM2061 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM2061 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2061 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM2061 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53803] VGAM2114 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM2114 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corre-

sponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2114 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM2114 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53804] VGAM2320 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM2320 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2320 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM2320 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53805] VGAM2327 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM2327 host target RNA, herein schematically represented by VGAM7

HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2327 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM2327 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53806] VGAM2532 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM2532 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2532 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM2532 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53807] It is appreciated that a function of VGR3846 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attack–

ing a host. Accordingly, utilities of VGR3846 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3846 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3846 gene: VGAM1723 host target protein, VGAM1864 host target protein, VGAM2018 host target protein, VGAM2061 host target protein, VGAM2114 host target protein, VGAM2320 host target protein, VGAM2327 host target protein and VGAM2532 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM1723, VGAM1864, VGAM2018, VGAM2061, VGAM2114, VGAM2320, VGAM2327 and VGAM2532

[53808] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3847(VGR3847) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates

expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53809] VGR3847 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3847 gene was detected is described hereinabove with reference to Figs. 6–15.

[53810] VGR3847 gene encodes VGR3847 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53811] VGR3847 precursor RNA folds spatially, forming VGR3847 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3847 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3847 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed–reversed sequence of the second half thereof, as is well known in the art.

[53812] VGR3847 folded precursor RNA, herein designated VGR

FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM2558 precursor RNA, VGAM2950 precursor RNA, VGAM2951 precursor RNA, VGAM3116 precursor RNA, VGAM3246 precursor RNA, VGAM3247 precursor RNA, VGAM3423 precursor RNA and VGAM3685 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53813] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM2558 RNA, VGAM2950 RNA, VGAM2951 RNA, VGAM3116 RNA, VGAM3246 RNA, VGAM3247 RNA, VGAM3423 RNA and VGAM3685 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53814] VGAM2558 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM2558 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2558 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM2558 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53815] VGAM2950 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM2950 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2950 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM2950 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of

Fig. 1.

[53816] VGAM2951 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM2951 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2951 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM2951 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53817] VGAM3116 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM3116 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3116 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM3116 host target protein, herein schematically

represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53818] VGAM3246 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM3246 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3246 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM3246 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53819] VGAM3247 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM3247 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3247 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA

into VGAM3247 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53820] VGAM3423 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM3423 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3423 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM3423 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53821] VGAM3685 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM3685 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3685 host target RNA, herein

schematically represented by VGAM8 HOST TARGET RNA into VGAM3685 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53822] It is appreciated that a function of VGR3847 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3847 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3847 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3847 gene: VGAM2558 host target protein, VGAM2950 host target protein, VGAM2951 host target protein, VGAM3116 host target protein, VGAM3246 host target protein, VGAM3247 host target protein, VGAM3423 host target protein and VGAM3685 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM2558, VGAM2950, VGAM2951,

VGAM3116, VGAM3246, VGAM3247, VGAM3423 and VGAM3685

[53823] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3848(VGR3848) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53824] VGR3848 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3848 gene was detected is described hereinabove with reference to Figs. 6–15.

[53825] VGR3848 gene encodes VGR3848 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53826] VGR3848 precursor RNA folds spatially, forming VGR3848 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3848 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art

as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3848 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53827] VGR3848 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM2742 precursor RNA and VGAM3547 precursor RNA, herein schematically represented by VGAM1 PRECURSOR and VGAM2 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53828] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM2742 RNA and VGAM3547 RNA respectively, herein schematically represented by VGAM1 RNA and VGAM2 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53829] VGAM2742 RNA, herein schematically represented by

VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM2742 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM2742 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM2742 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53830] VGAM3547 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM3547 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM3547 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM3547 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53831] It is appreciated that a function of VGR3848 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3848 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3848 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3848 gene: VGAM2742 host target protein and VGAM3547 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN and VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM2742 and VGAM3547

[53832] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3849(VGR3849) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53833] VGR3849 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3849 gene was detected is described hereinabove with reference to Figs. 6–15.

[53834] VGR3849 gene encodes VGR3849 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53835] VGR3849 precursor RNA folds spatially, forming VGR3849 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3849 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3849 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed–reversed sequence of the second half thereof, as is well known in the art.

[53836] VGR3849 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM91 precursor RNA, VGAM92 precursor

RNA, VGAM93 precursor RNA, VGAM101 precursor RNA, VGAM395 precursor RNA, VGAM446 precursor RNA, VGAM447 precursor RNA and VGAM603 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53837] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM91 RNA, VGAM92 RNA, VGAM93 RNA, VGAM101 RNA, VGAM395 RNA, VGAM446 RNA, VGAM447 RNA and VGAM603 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53838] VGAM91 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM91 host

target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM91 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM91 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53839] VGAM92 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM92 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM92 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM92 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53840] VGAM93 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding

site located in an untranslated region of VGAM93 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM93 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM93 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53841] VGAM101 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM101 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM101 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM101 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53842] VGAM395 RNA, herein schematically represented by

VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM395 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM395 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM395 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53843] VGAM446 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM446 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM446 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM446 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53844] VGAM447 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM447 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM447 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM447 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53845] VGAM603 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM603 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM603 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM603 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of

Fig. 1.

[53846] It is appreciated that a function of VGR3849 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3849 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3849 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3849 gene: VGAM91 host target protein, VGAM92 host target protein, VGAM93 host target protein, VGAM101 host target protein, VGAM395 host target protein, VGAM446 host target protein, VGAM447 host target protein and VGAM603 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM91, VGAM92, VGAM93, VGAM101, VGAM395, VGAM446, VGAM447 and VGAM603

[53847] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred

to here as Viral Genomic Record 3850(VGR3850) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53848] VGR3850 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3850 gene was detected is described hereinabove with reference to Figs. 6–15.

[53849] VGR3850 gene encodes VGR3850 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53850] VGR3850 precursor RNA folds spatially, forming VGR3850 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3850 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3850 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which

is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53851] VGR3850 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM605 precursor RNA, VGAM949 precursor RNA, VGAM980 precursor RNA, VGAM981 precursor RNA, VGAM987 precursor RNA, VGAM1044 precursor RNA, VGAM1506 precursor RNA and VGAM1507 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53852] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM605 RNA, VGAM949 RNA, VGAM980 RNA, VGAM981 RNA, VGAM987 RNA, VGAM1044 RNA, VGAM1506 RNA and VGAM1507 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4

RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53853] VGAM605 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM605 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM605 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM605 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53854] VGAM949 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding site located in an untranslated region of VGAM949 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM949 host target RNA, herein

schematically represented by VGAM2 HOST TARGET RNA into VGAM949 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53855] VGAM980 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM980 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM980 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM980 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53856] VGAM981 RNA, herein schematically represented by VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM981 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby in-

hibiting translation of VGAM981 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM981 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53857] VGAM987 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM987 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM987 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM987 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53858] VGAM1044 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM1044 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1044 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM1044 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53859] VGAM1506 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM1506 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1506 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM1506 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of Fig. 1.

[53860] VGAM1507 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM1507 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corre-

sponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1507 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM1507 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53861] It is appreciated that a function of VGR3850 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3850 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3850 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3850 gene: VGAM605 host target protein, VGAM949 host target protein, VGAM980 host target protein, VGAM981 host target protein, VGAM987 host target protein, VGAM1044 host target protein, VGAM1506 host target protein and VGAM1507 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TAR-

GET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM605, VGAM949, VGAM980, VGAM981, VGAM987, VGAM1044, VGAM1506 and VGAM1507

[53862] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3851(VGR3851) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53863] VGR3851 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3851 gene was detected is described hereinabove with reference to Figs. 6–15.

[53864] VGR3851 gene encodes VGR3851 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53865] VGR3851 precursor RNA folds spatially, forming VGR3851 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3851 folded

precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3851 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53866] VGR3851 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM1508 precursor RNA, VGAM1509 precursor RNA, VGAM1510 precursor RNA, VGAM1511 precursor RNA, VGAM1513 precursor RNA, VGAM1603 precursor RNA, VGAM1720 precursor RNA and VGAM1909 precursor RNA, herein schematically represented by VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53867] The above mentioned VGAM precursor RNAs are diced by

DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM1508 RNA, VGAM1509 RNA, VGAM1510 RNA, VGAM1511 RNA, VGAM1513 RNA, VGAM1603 RNA, VGAM1720 RNA and VGAM1909 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53868] VGAM1508 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM1508 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1508 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM1508 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.

[53869] VGAM1509 RNA, herein schematically represented by VGAM2 binds complementarily to a host target binding

site located in an untranslated region of VGAM1509 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1509 host target RNA, herein schematically represented by VGAM2 HOST TARGET RNA into VGAM1509 host target protein, herein schematically represented by VGAM2 HOST TARGET PROTEIN, both of Fig. 1.

[53870] VGAM1510 RNA, herein schematically represented by VGAM3 binds complementarily to a host target binding site located in an untranslated region of VGAM1510 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1510 host target RNA, herein schematically represented by VGAM3 HOST TARGET RNA into VGAM1510 host target protein, herein schematically represented by VGAM3 HOST TARGET PROTEIN, both of Fig. 1.

[53871] VGAM1511 RNA, herein schematically represented by

VGAM4 binds complementarily to a host target binding site located in an untranslated region of VGAM1511 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1511 host target RNA, herein schematically represented by VGAM4 HOST TARGET RNA into VGAM1511 host target protein, herein schematically represented by VGAM4 HOST TARGET PROTEIN, both of Fig. 1.

[53872] VGAM1513 RNA, herein schematically represented by VGAM5 binds complementarily to a host target binding site located in an untranslated region of VGAM1513 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1513 host target RNA, herein schematically represented by VGAM5 HOST TARGET RNA into VGAM1513 host target protein, herein schematically represented by VGAM5 HOST TARGET PROTEIN, both of Fig. 1.

[53873] VGAM1603 RNA, herein schematically represented by VGAM6 binds complementarily to a host target binding site located in an untranslated region of VGAM1603 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1603 host target RNA, herein schematically represented by VGAM6 HOST TARGET RNA into VGAM1603 host target protein, herein schematically represented by VGAM6 HOST TARGET PROTEIN, both of Fig. 1.

[53874] VGAM1720 RNA, herein schematically represented by VGAM7 binds complementarily to a host target binding site located in an untranslated region of VGAM1720 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1720 host target RNA, herein schematically represented by VGAM7 HOST TARGET RNA into VGAM1720 host target protein, herein schematically represented by VGAM7 HOST TARGET PROTEIN, both of

Fig. 1.

[53875] VGAM1909 RNA, herein schematically represented by VGAM8 binds complementarily to a host target binding site located in an untranslated region of VGAM1909 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM1909 host target RNA, herein schematically represented by VGAM8 HOST TARGET RNA into VGAM1909 host target protein, herein schematically represented by VGAM8 HOST TARGET PROTEIN, both of Fig. 1.

[53876] It is appreciated that a function of VGR3851 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR3851 gene include diagnosis, prevention and treatment of viral infection by . Specific functions, and accordingly utilities, of VGR3851 gene, herein designated VGR GENE, correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the operon-like cluster of VGR3851 gene: VGAM1508

host target protein, VGAM1509 host target protein, VGAM1510 host target protein, VGAM1511 host target protein, VGAM1513 host target protein, VGAM1603 host target protein, VGAM1720 host target protein and VGAM1909 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM HOST TARGET PROTEIN respectively. The function of these host target genes is elaborated hereinabove with reference to VGAM1508, VGAM1509, VGAM1510, VGAM1511, VGAM1513, VGAM1603, VGAM1720 and VGAM1909

[53877] Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 3852(VGR3852) viral gene, which encodes an operon-like cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[53878] VGR3852 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR3852 gene was detected is described hereinabove with reference to Figs.

6-15.

[53879] VGR3852 gene encodes VGR3852 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[53880] VGR3852 precursor RNA folds spatially, forming VGR3852 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR3852 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of VGR3852 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[53881] VGR3852 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM1914 precursor RNA, VGAM1951 precursor RNA, VGAM1952 precursor RNA, VGAM1953 precursor RNA, VGAM1954 precursor RNA, VGAM1955 precursor RNA, VGAM1956 precursor RNA and VGAM1957 precursor RNA, herein schematically represented by

VGAM1 PRECURSOR, VGAM2 PRECURSOR, VGAM3 PRECURSOR, VGAM4 PRECURSOR, VGAM5 PRECURSOR, VGAM6 PRECURSOR, VGAM7 PRECURSOR and VGAM8 PRECURSOR respectively, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM PRECURSOR RNA of Fig. 8.

[53882] The above mentioned VGAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, VGAM1914 RNA, VGAM1951 RNA, VGAM1952 RNA, VGAM1953 RNA, VGAM1954 RNA, VGAM1955 RNA, VGAM1956 RNA and VGAM1957 RNA respectively, herein schematically represented by VGAM1 RNA, VGAM2 RNA, VGAM3 RNA, VGAM4 RNA, VGAM5 RNA, VGAM6 RNA, VGAM7 RNA and VGAM8 RNA respectively, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 8.

[53883] VGAM1914 RNA, herein schematically represented by VGAM1 binds complementarily to a host target binding site located in an untranslated region of VGAM1914 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby in-

hibiting translation of VGAM1914 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA into VGAM1914 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN, both of Fig. 1.
